EBUS-TBNA操作介紹

INTERVENTIONAL PULMONOLOGY CENTER

中國附醫支氣管鏡診治中心

支氣管鏡診治中心特色

全面且深入的發展介入性支氣管鏡的診治功能

診斷性氣管鏡

- 內視鏡超音波
- 支氣管內視鏡超音波
導引細針穿刺抽吸術
- 自體螢光內視鏡

治療性支氣管鏡

- 電燒
- 氣管支架置放
- 氣管氣球擴張
- 氣管異物夾取
- 支氣管鏡輔助經皮擴張氣管切開術

Pleuroscopy
肋膜腔鏡

Cryotherapy
冷凍治療

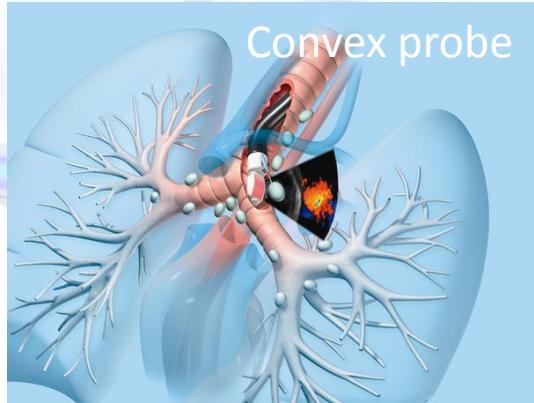

2016

APC
氫氣電漿凝固術

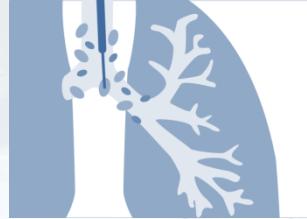

Radial probe

Convex probe

2004-
UM-S20-20R radial balloon probe

2002-
Real-time of (TBNA)

1999-
20 MHz radial balloon probe

1992-
12 MHz radial probe

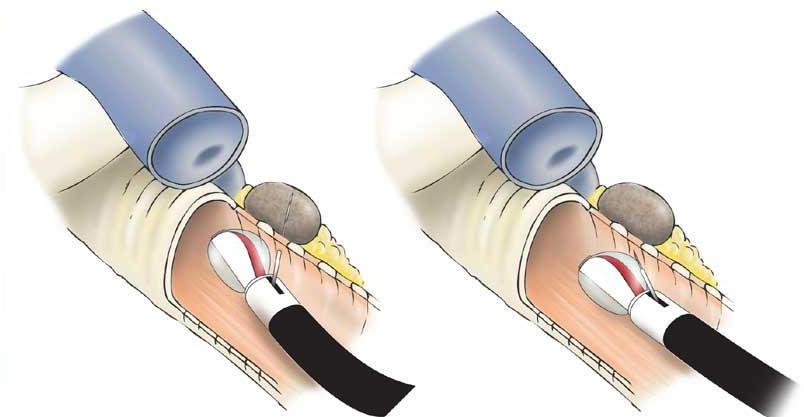

1988-
7.5 MHz radial probe

EBUS-TBNA操作介紹

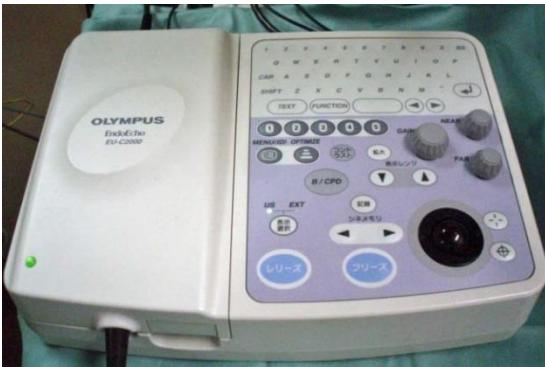

EBUS SCOPE

EBUS BF-UC180F

Ultrasound processor

- 1st generation
- With color Doppler mode

- With EBUS and EBUS-TBNA
- With Doppler, THI, power mode

- With elastography
- Pulse Wave Doppler B mode

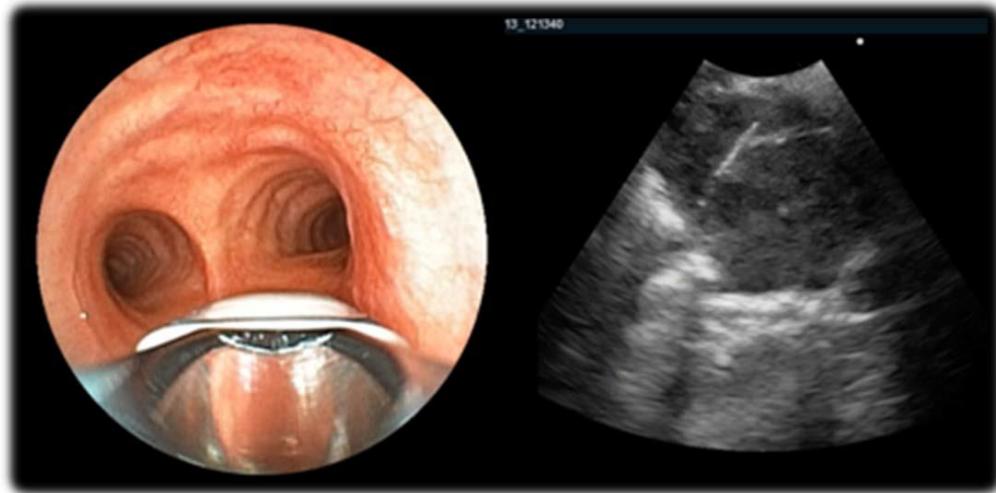

EBUS - EB1970UK

- 6.3mm Insertion Tube
- 2mm working channel
- Color CCD video images
 - 45° Forward Oblique
- Hitachi 5500 scanner
 - 75° Forward Oblique
- 5, 6.5, 7.5, 9, 10 MHz options

EBUS scope – EB-530US

- 10° forward oblique view
- Wide Field of View: 120°

OLYMPUS**PENTAX**
MEDICAL**FUJIFILM**

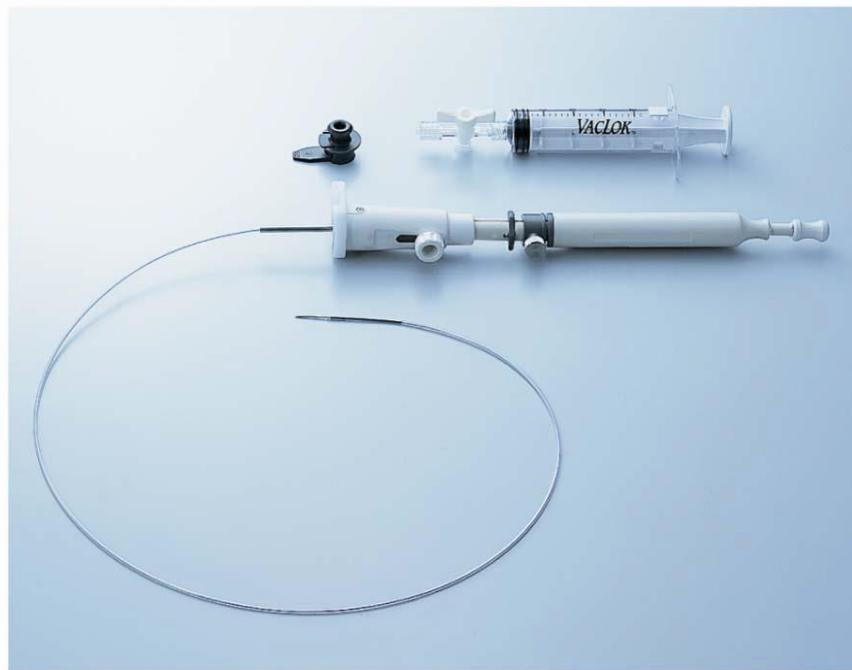

廠牌	OLYMPUS	PENTAX	FUJIFILM

EBUS-TBNA NEEDLE

NA-201SX-4022, 4021

19G, 21G, 22G

SonoTip EBUS Pro Flex

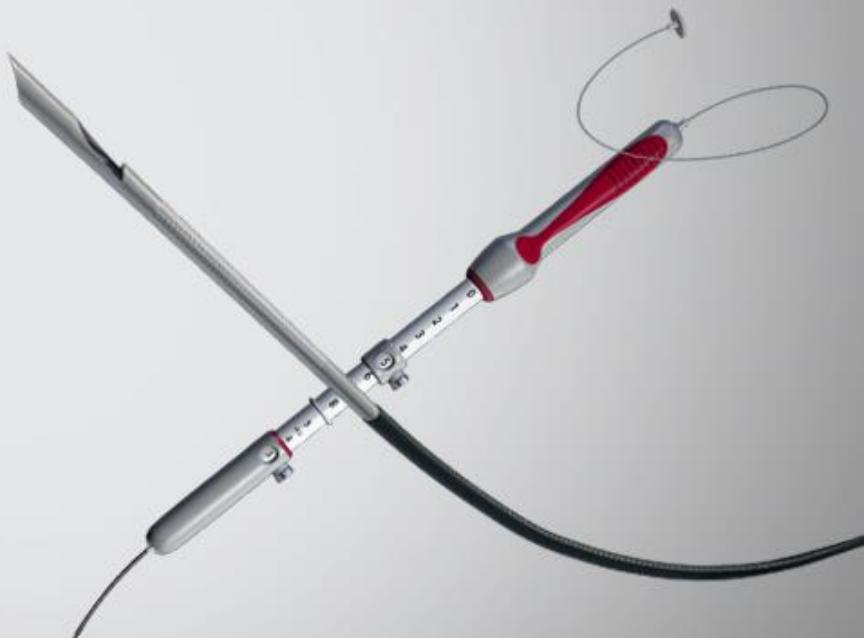

- ↗ Dimensionally Stable Nitinol Needle
Eliminates needle deformation ("Banana-Effect") after initial puncture for precise needle positioning in repeated passes
- ↗ Twist-Lock Technology for Sheath & Needle Length Adjustment
Single hand operation
Needle length adjustment (0 - 4 cm)
- ↗ Blue Colored Plastic Sheath
Creates a high contrast image under endoscopic visualization providing clear identification of the outer sheath and the respiratory tract for precise needle guidance
- ↗ Luer-locking Needle and Stylet
Provides exact needle and stylet tip positioning

EchoTip ProCore EBUS Needles

- Core trap design to obtain tissue
- 22G and 25G

EBUS: 21g vs 22g needle

TABLE 2. Classification of Histologic Specimens Obtained by EBUS-TBNA

Category of Histologic Specimens	Needle Size for EBUS-TBNA	
	21-gauge	22-gauge
I. Diagnostic	35 (58)	34 (57)
II. Nondiagnostic, adequate	8 (13)	13 (22)
III. Nondiagnostic, inadequate	15 (25)	7 (12)
IV. No specimens	2 (3)	6 (10)

Data are presented as n (%). Using the χ^2 test, $P = 0.40$ across the sampling yield of adequate histologic specimens (I and II) in the needle sizes.

EBUS-TBNA indicates endobronchial ultrasound-guided transbronchial needle aspiration.

使用21號針，

Table 1 Results of evaluated factors of each needle

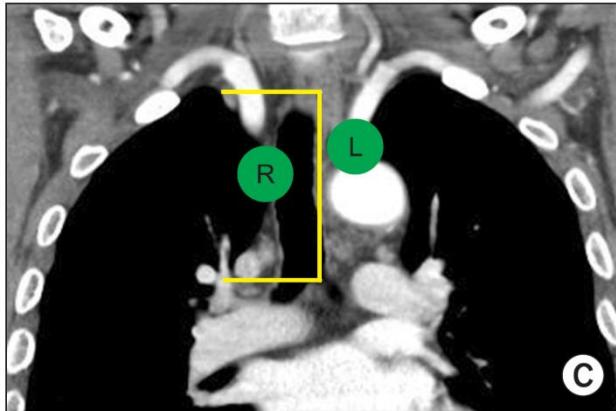

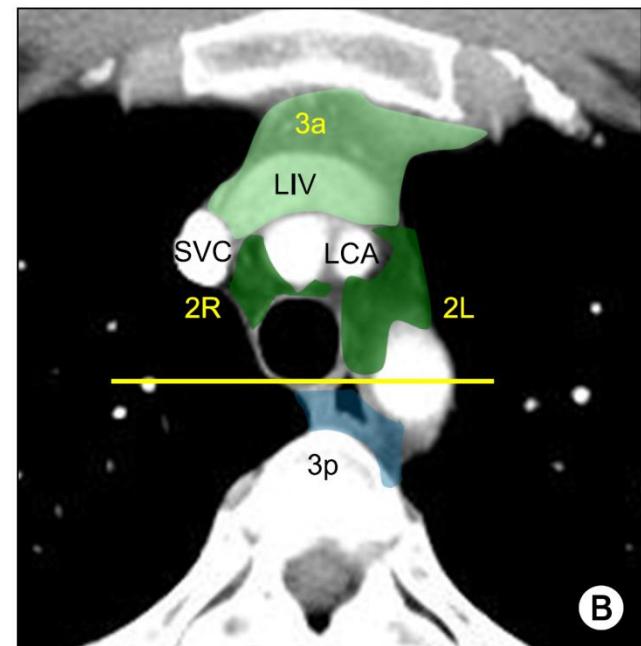

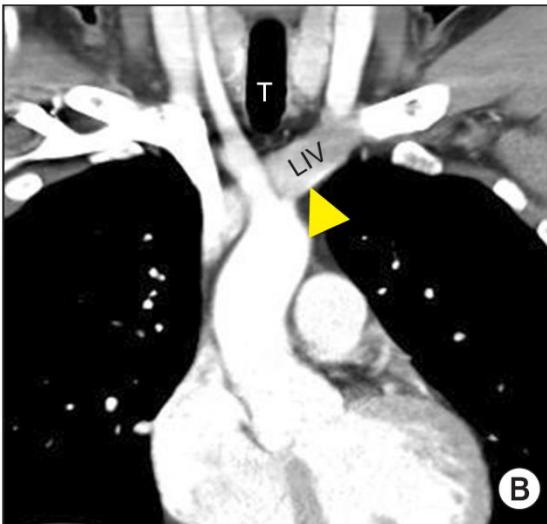

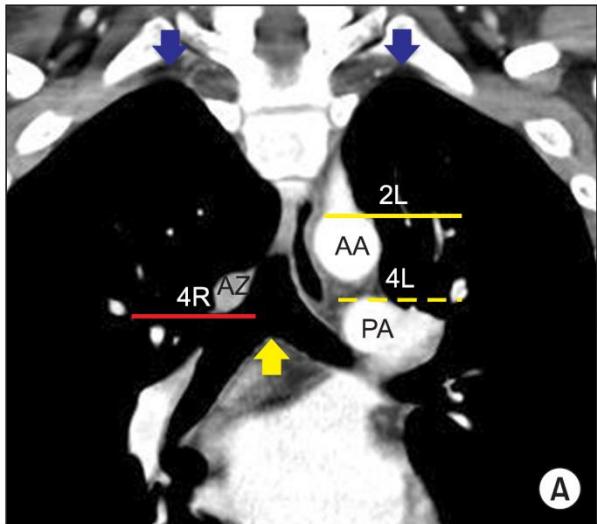

Evaluated factors ($n = 45$)	22G > 21G	22G = 21G	22G < 21G	P-value
Cytology				
Number of tumour cells ($n =$)	11	12	22	$P = 0.0256$
Blood contamination ($n =$)	3	9	33	$P < 0.0001$
Histology				
Quantity of tissue ($n =$)	14	16	15	$P = 0.9661$

EBUS-TBNA操作介紹

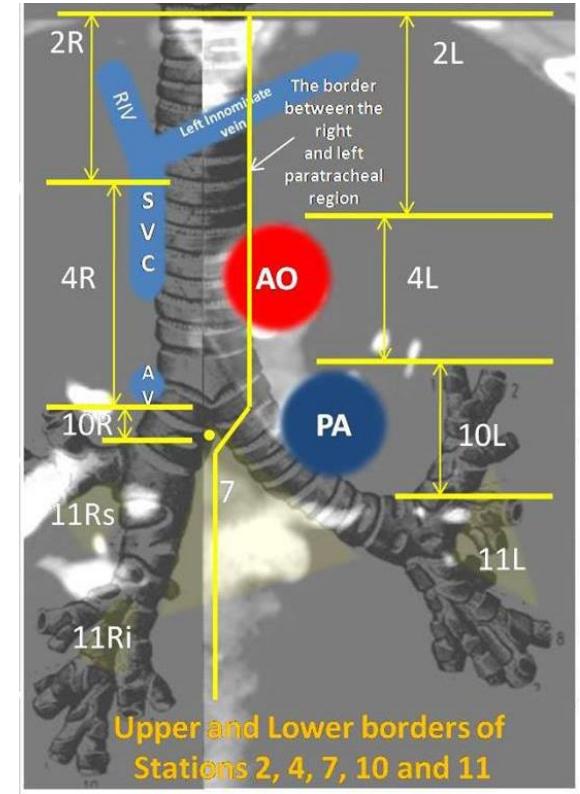

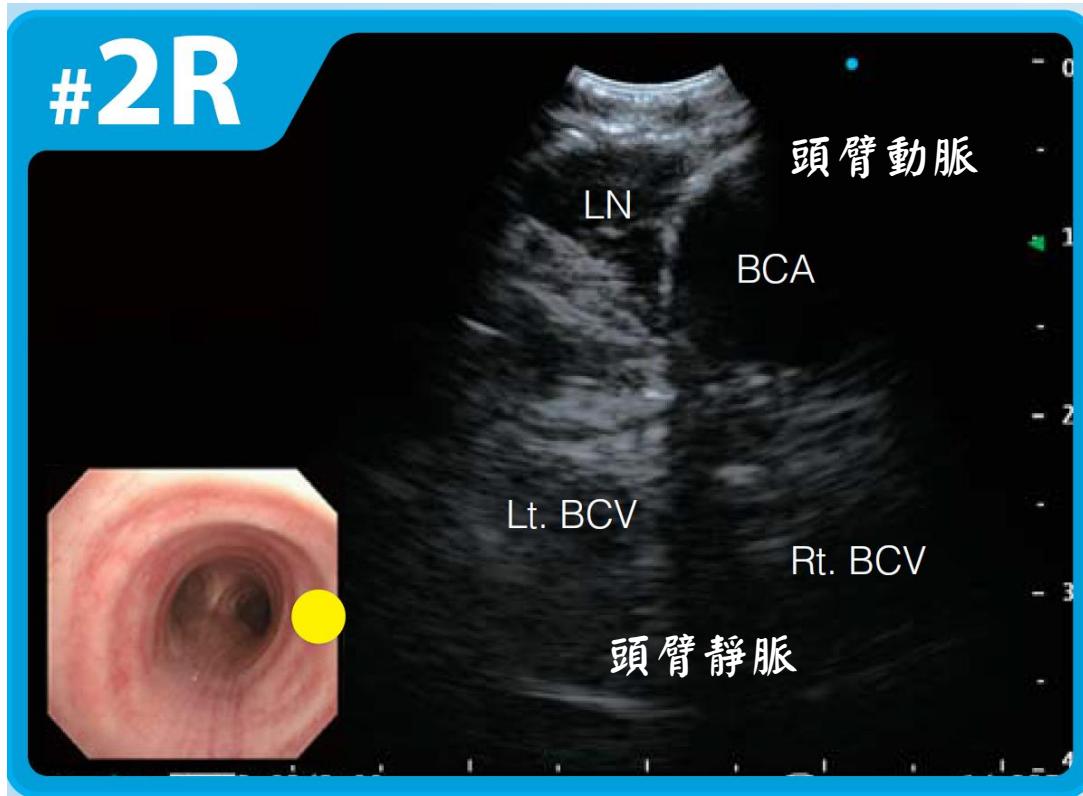

LYMPH NODE

Group 2 Upper Paratrachea

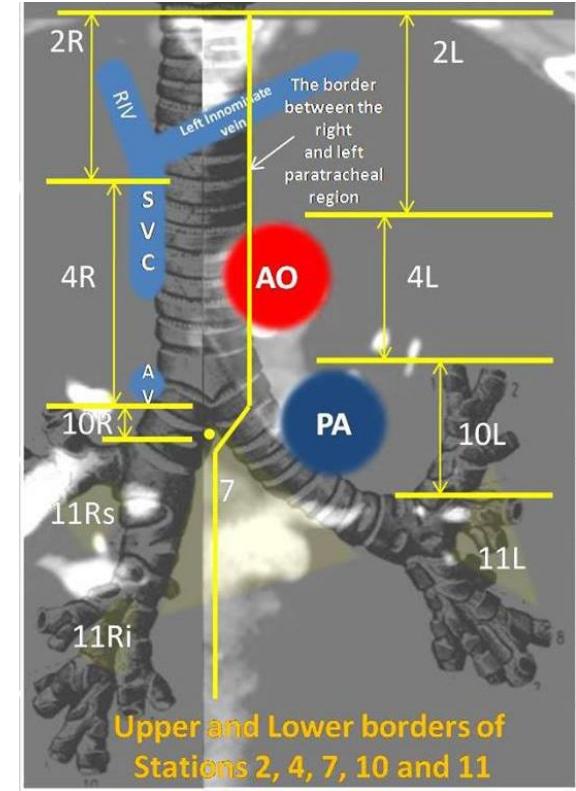

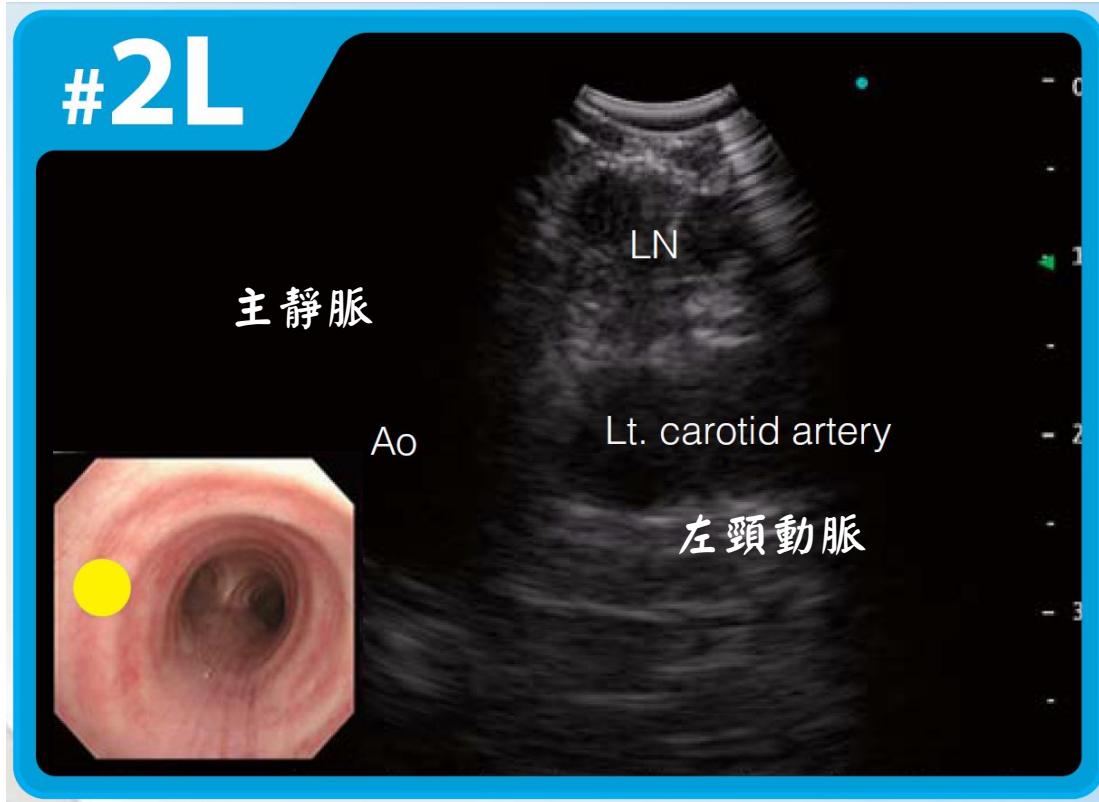

Group 2R

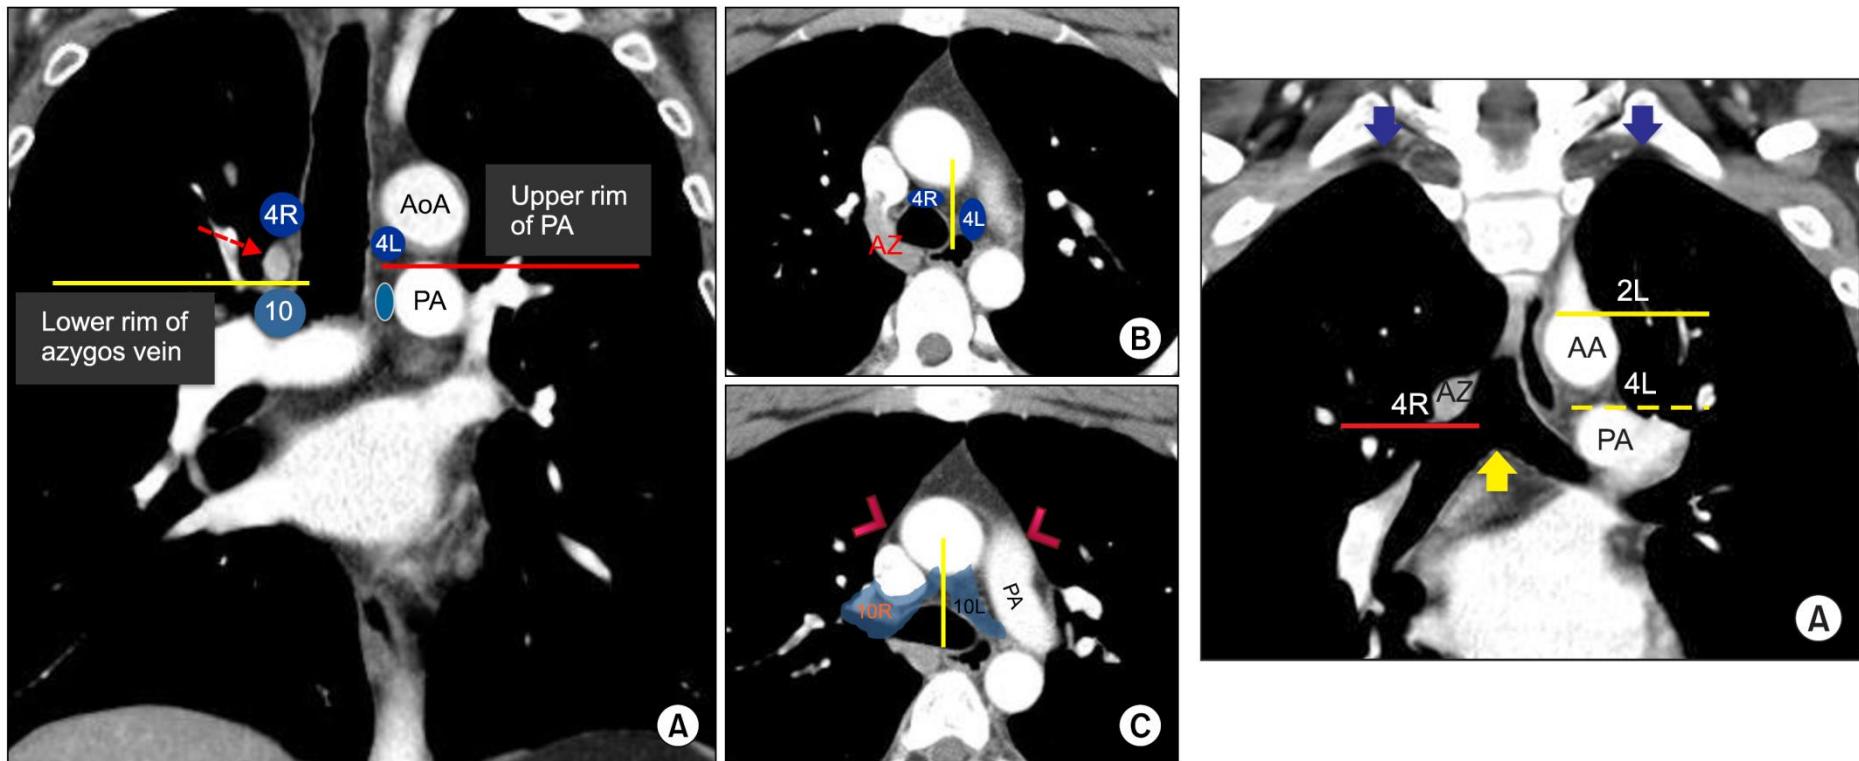

While visualizing the SVC on the ultrasound image, withdraw the bronchoscope maintaining contact with the trachea at the two to three o'clock position. The SVC will bifurcate to the left and right brachiocephalic veins. Any lymph node distal to the bifurcation along the right side of the trachea is station #2R.

Group 2L

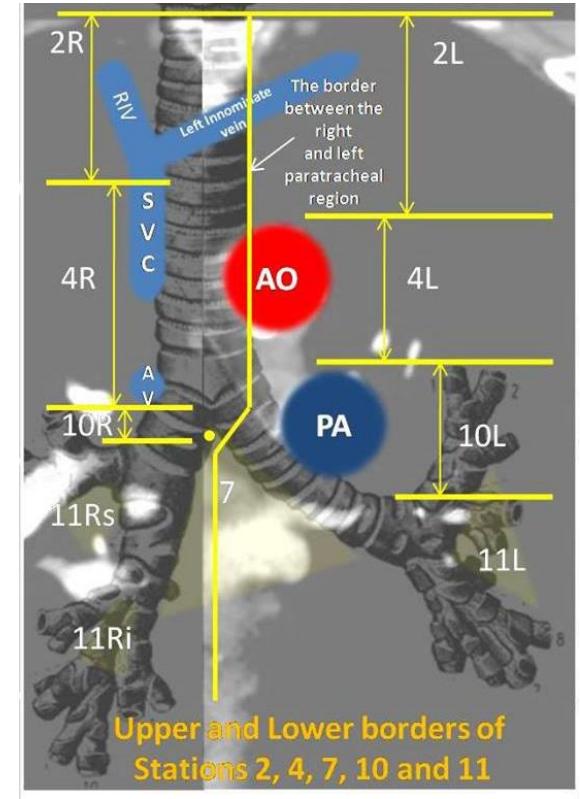

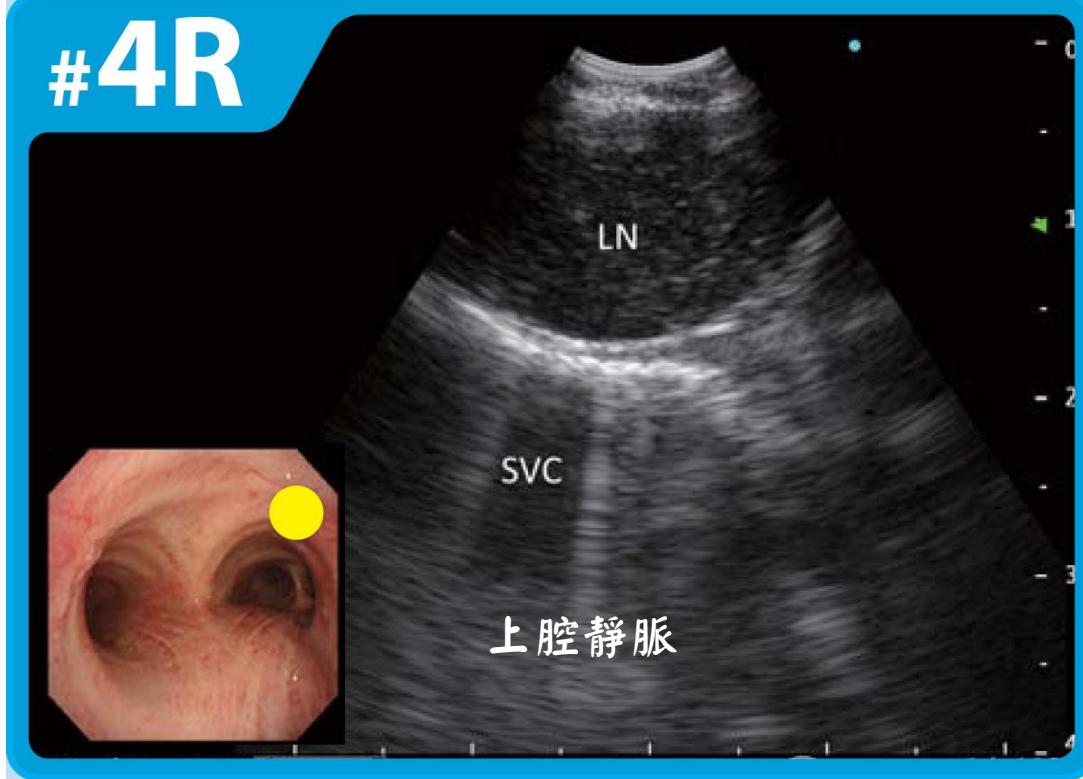

The aortic arch is the vascular landmark for differentiating station #2L and #4L. Lymph node present on the left side of the trachea above the aortic arch is station #2L.

Group 4 Lower Paratrachea

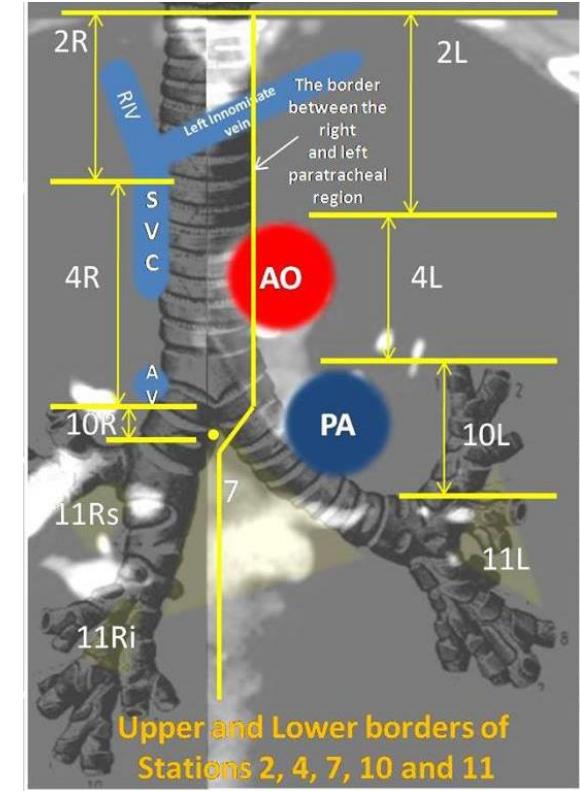

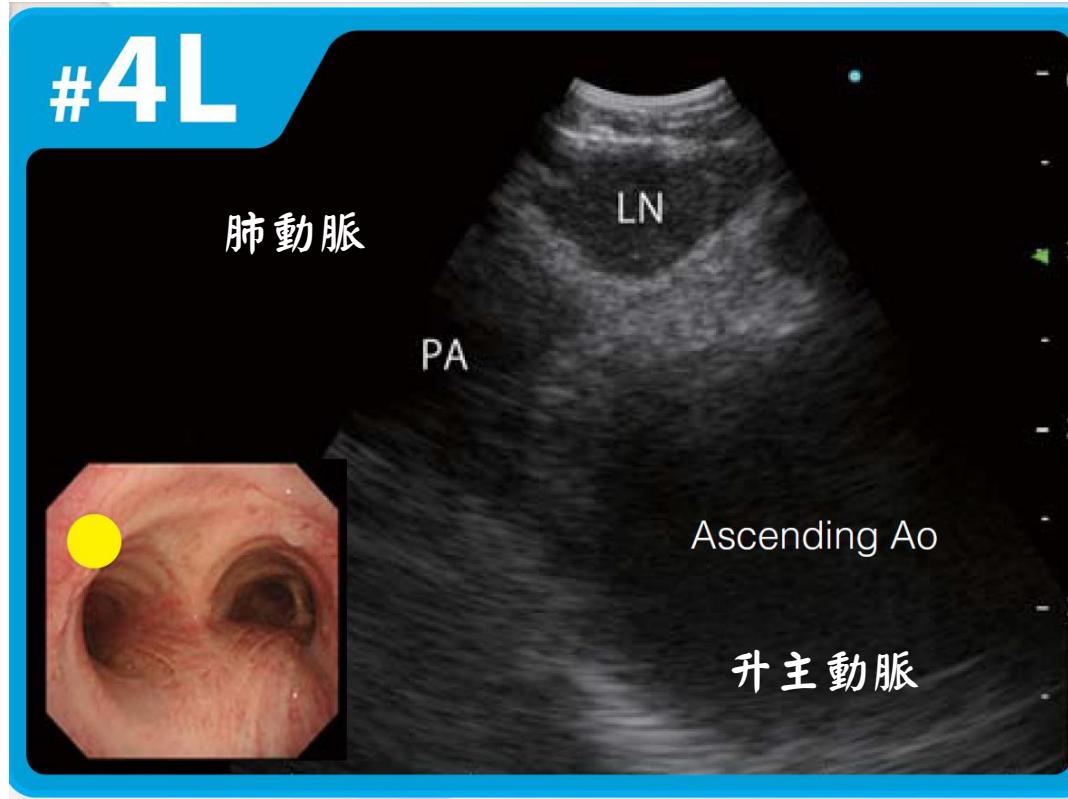

Group 4R

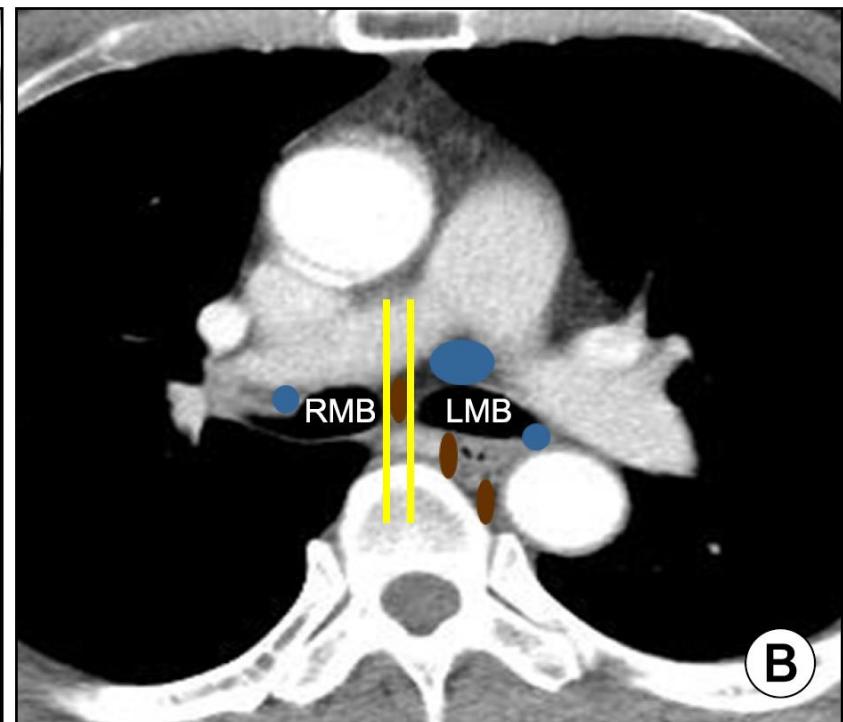

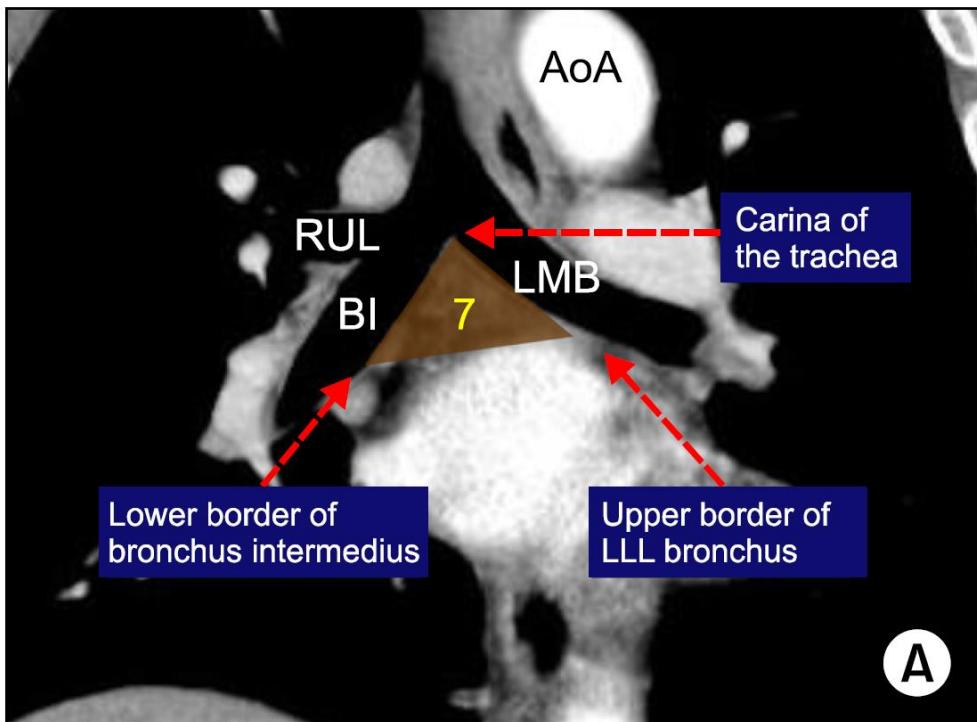

Withdraw the bronchoscope to the trachea looking straight towards the main carina. Turn to the two o'clock position and press the tip just proximal to the main carina. Look for the SVC and the azygos vein branching from the SVC. Station #4R is close to the SVC and the azygos vein.

Group 4L

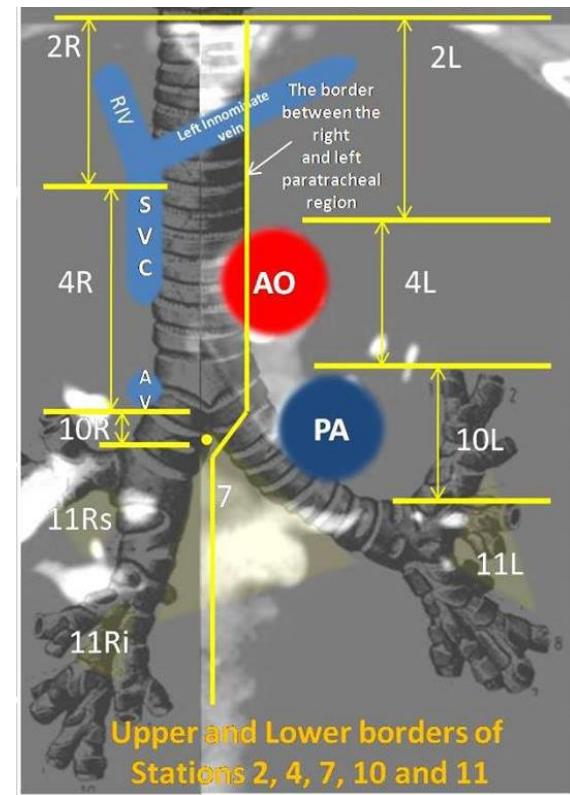

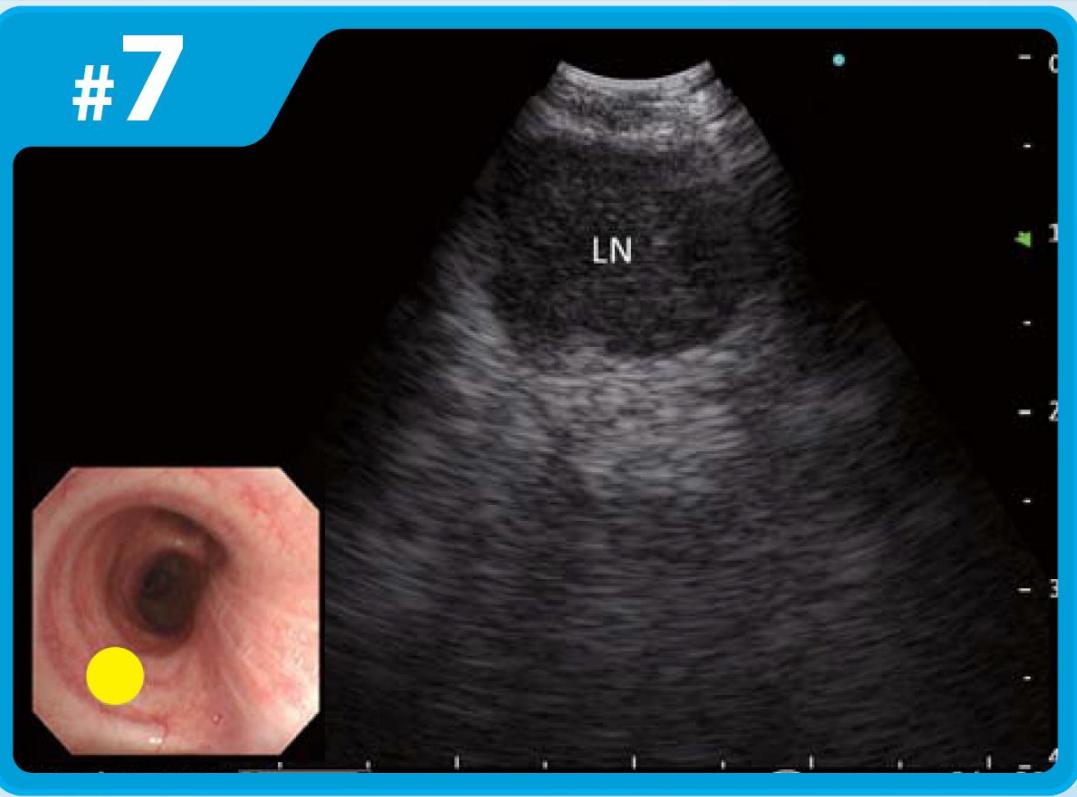

Facing the main carina, turn the bronchoscope to the 10 o'clock position and press the tip just proximal to the main carina and scan the area for station #4L. The aortic arch can be followed to the aorto-pulmonary window. The aortic arch is proximal and the left main pulmonary artery is distal.

Group 7 Subcarina

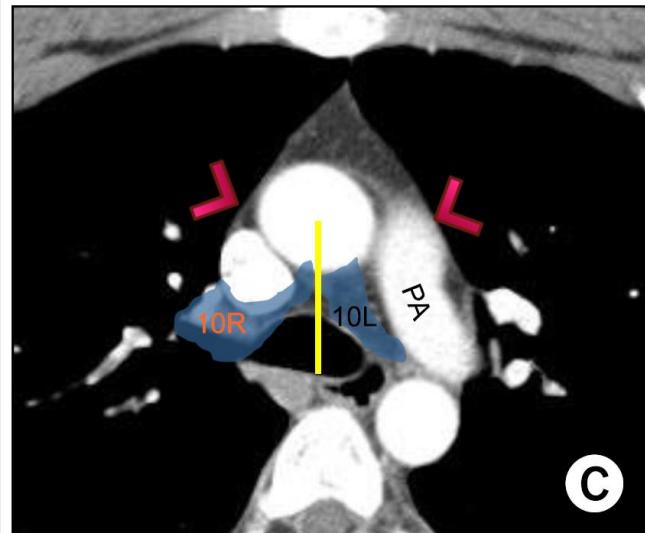

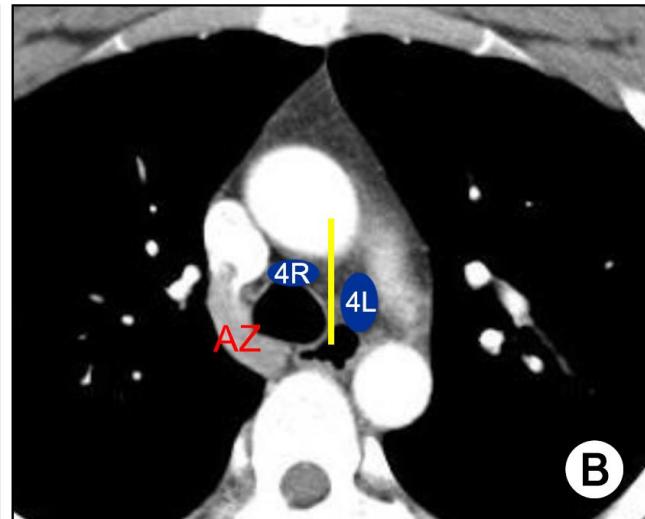

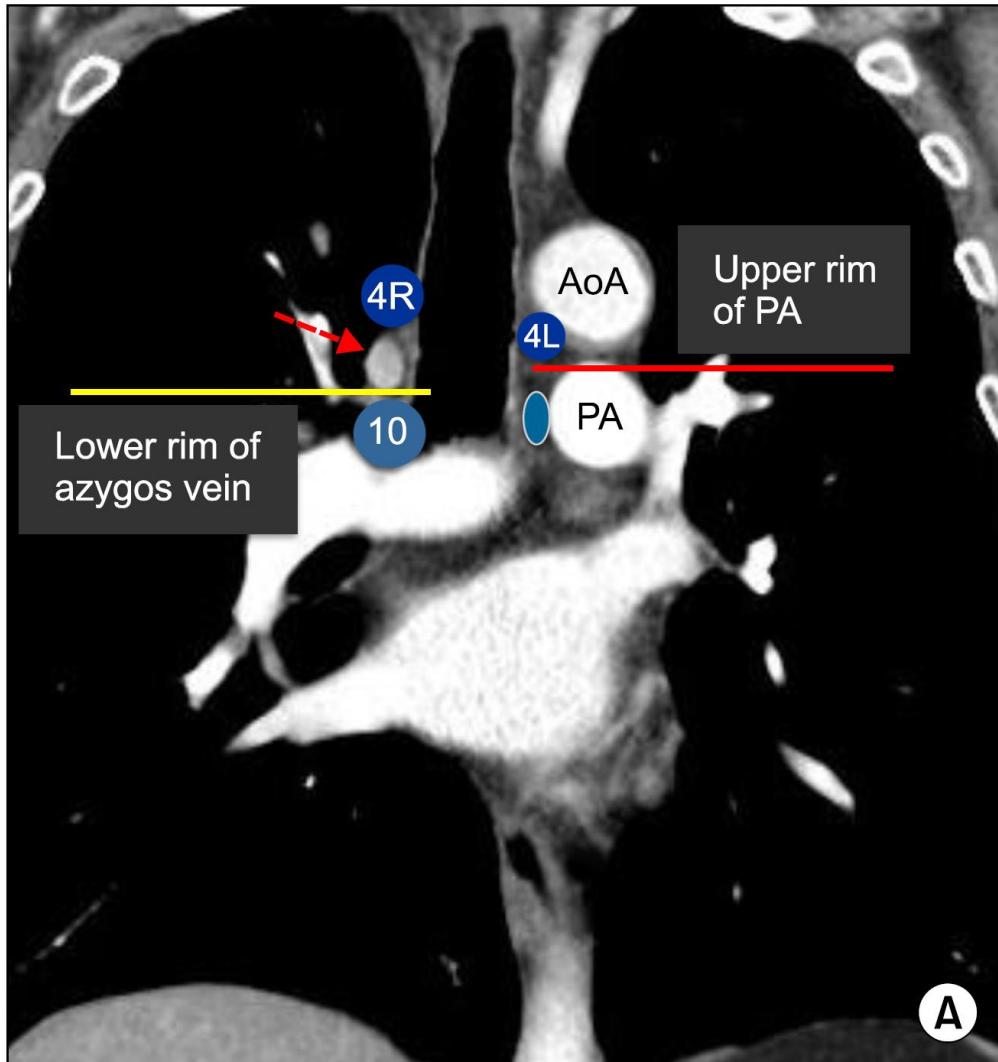

Group 7

#7

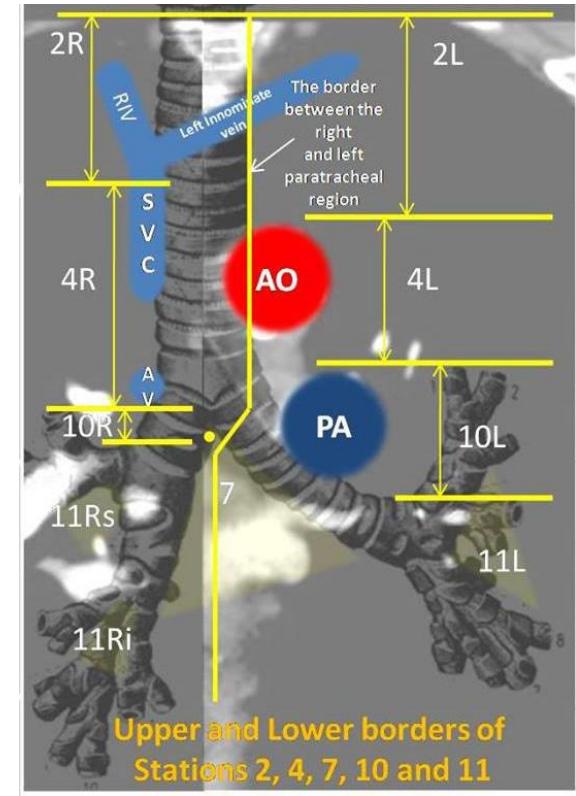

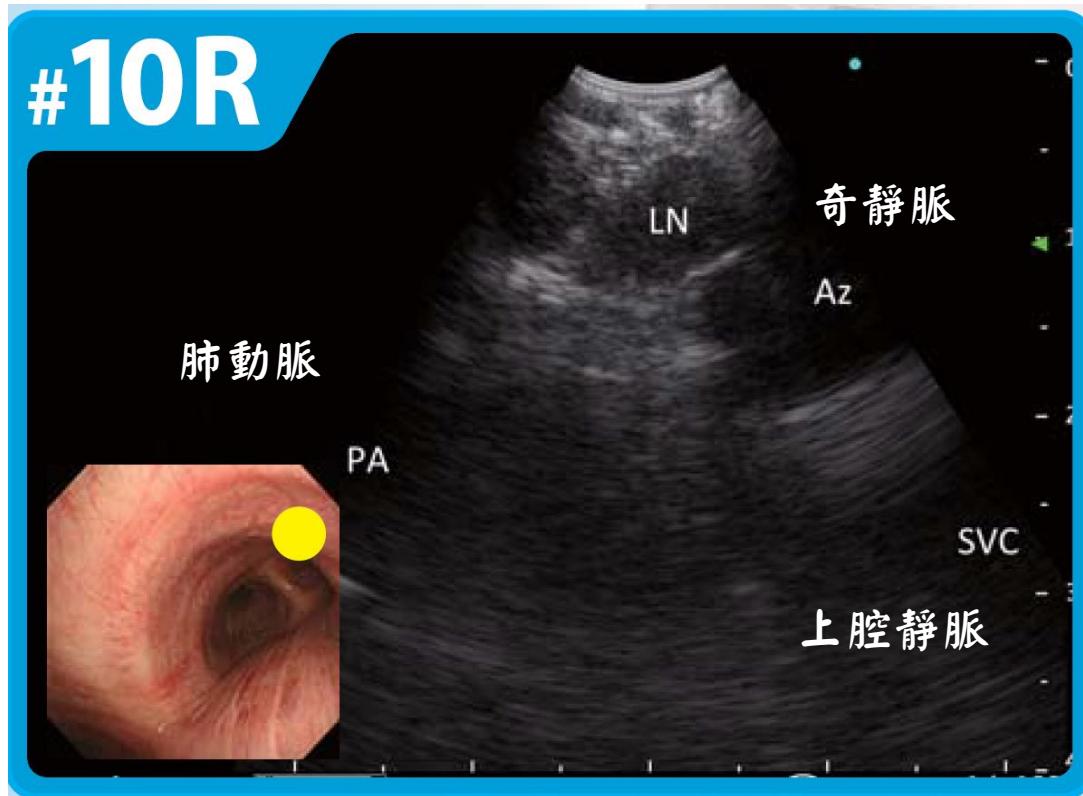

Station #7 can be visualized from either the right or the left main bronchus. On the right side, turn to the 12 o'clock position and press the tip against the right main bronchus where the main stem of the pulmonary artery is visualized. After confirmation with the Doppler mode, turn the tip to the nine o'clock position to visualize station #7. Lymph node distal to station #7 along the main bronchus is station #10R.

Group 10 Hilar nodes

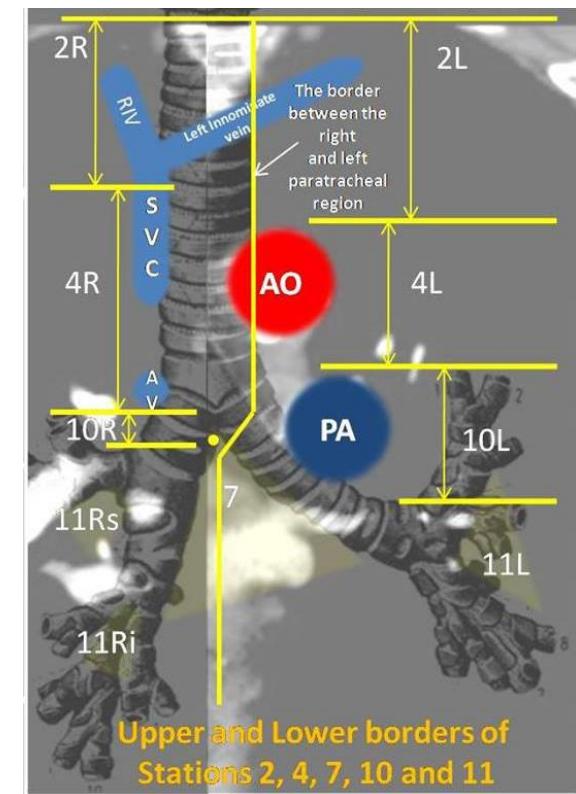

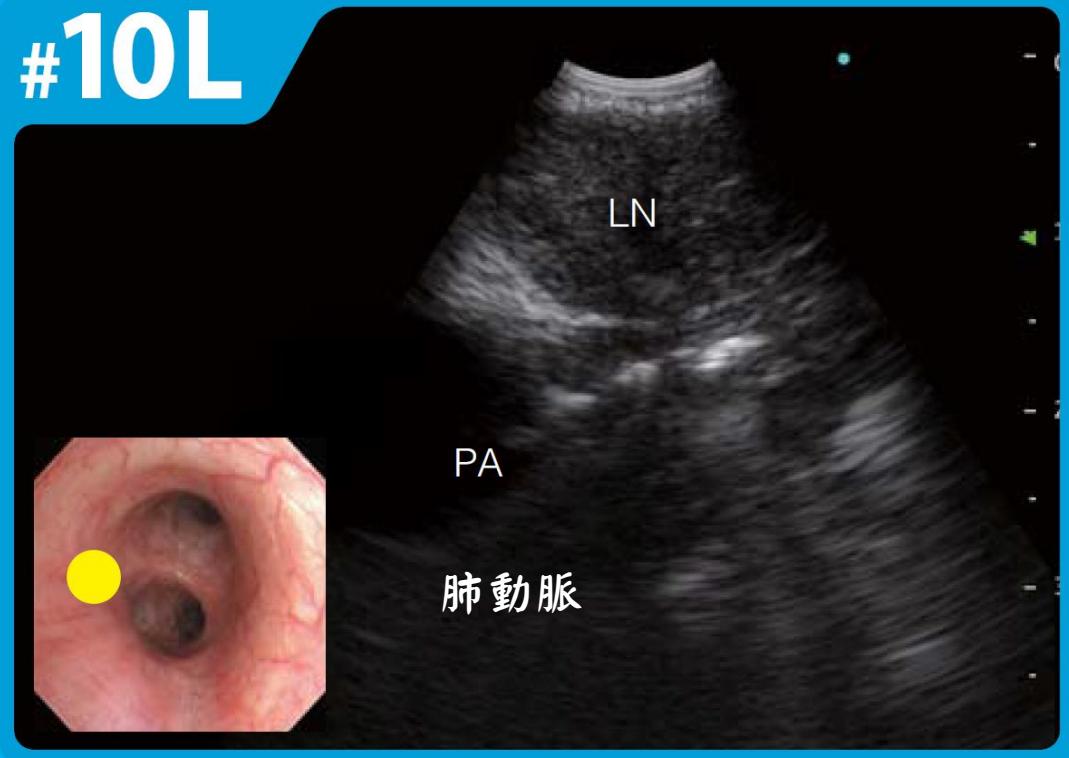

Group 10R

Withdraw the bronchoscope to the right main bronchus. Turn the tip to the three o'clock position and press the tip to visualize station #10R. Station #10R also lies just distal to station #7 along the right main bronchus. This part is visualized after identifying station #7 at the nine o'clock position at the right main bronchus.

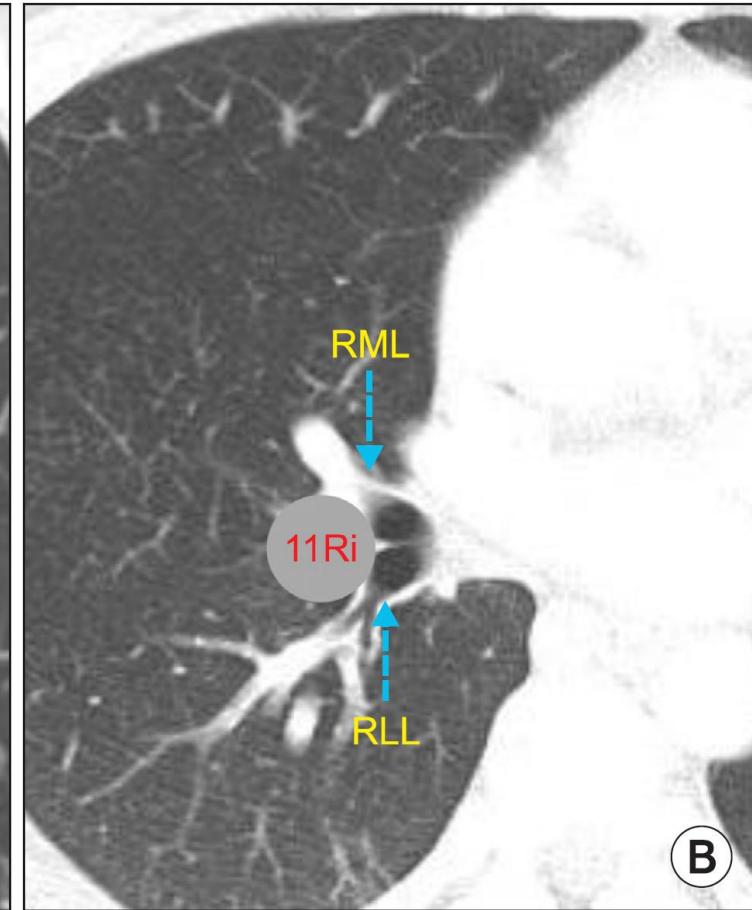

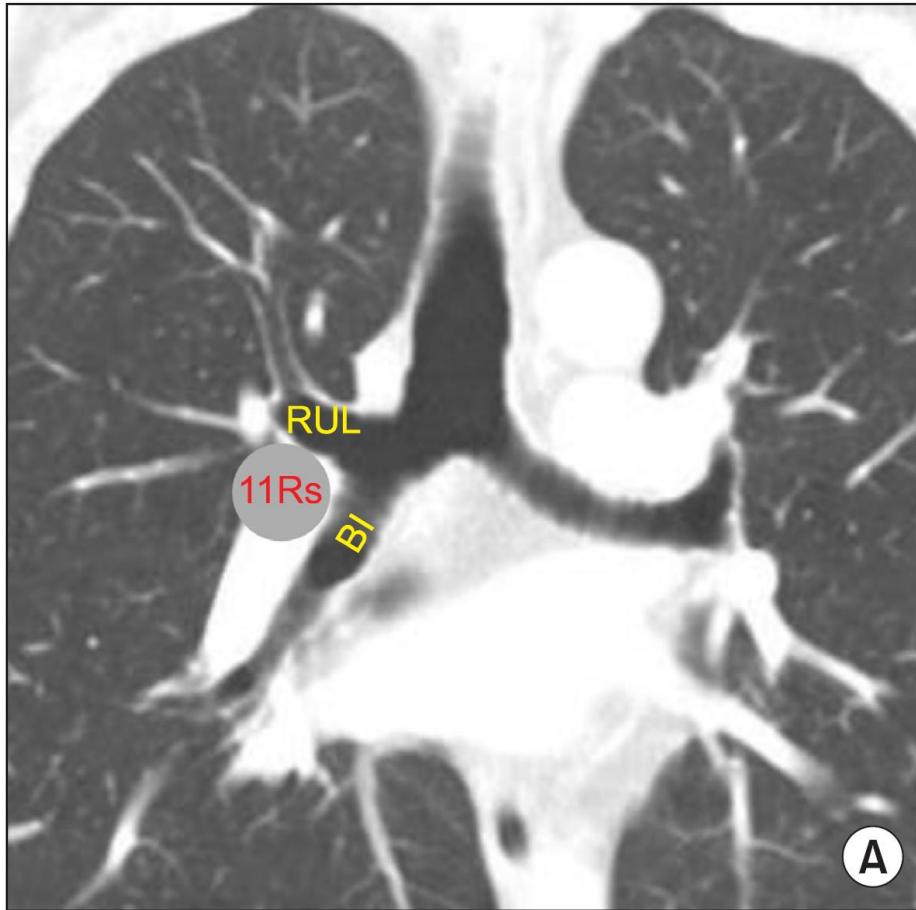

Group 10L

#10L

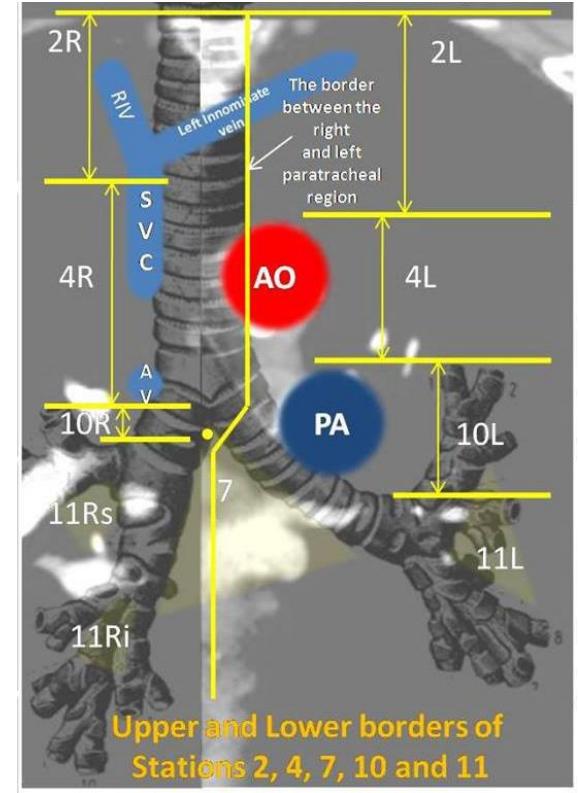

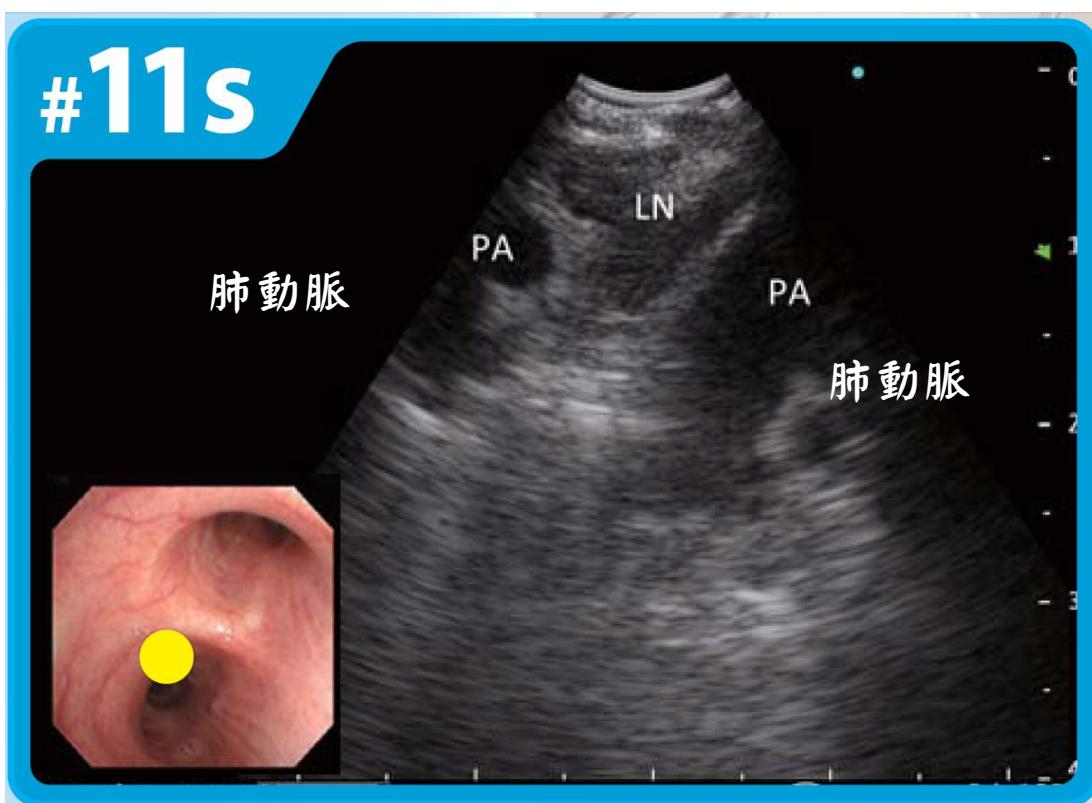

Advance the bronchoscope into the left main bronchus at the 10 o'clock position by following the left pulmonary artery on ultrasound image. This is the area of station #10L. Similar to station #10R, #10L can be visualized distal to station #7 at the three o'clock position on the left main bronchus.

Group 11 Interlobar node

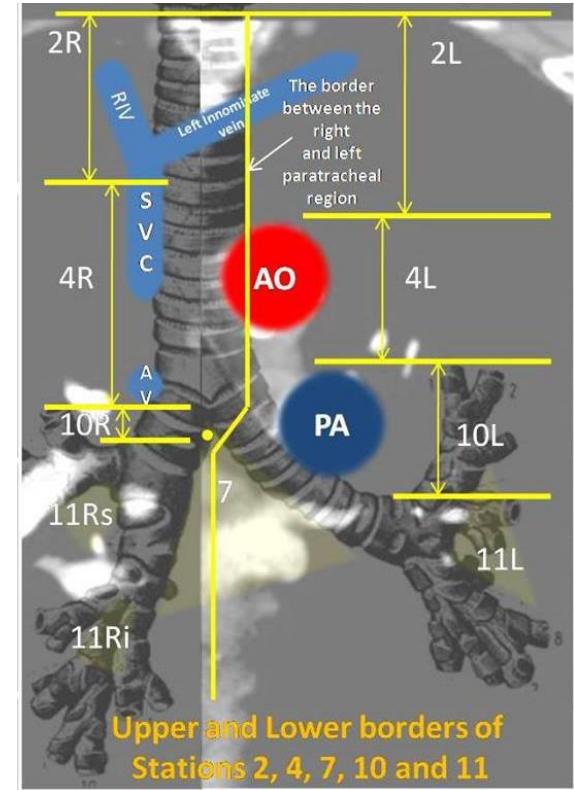

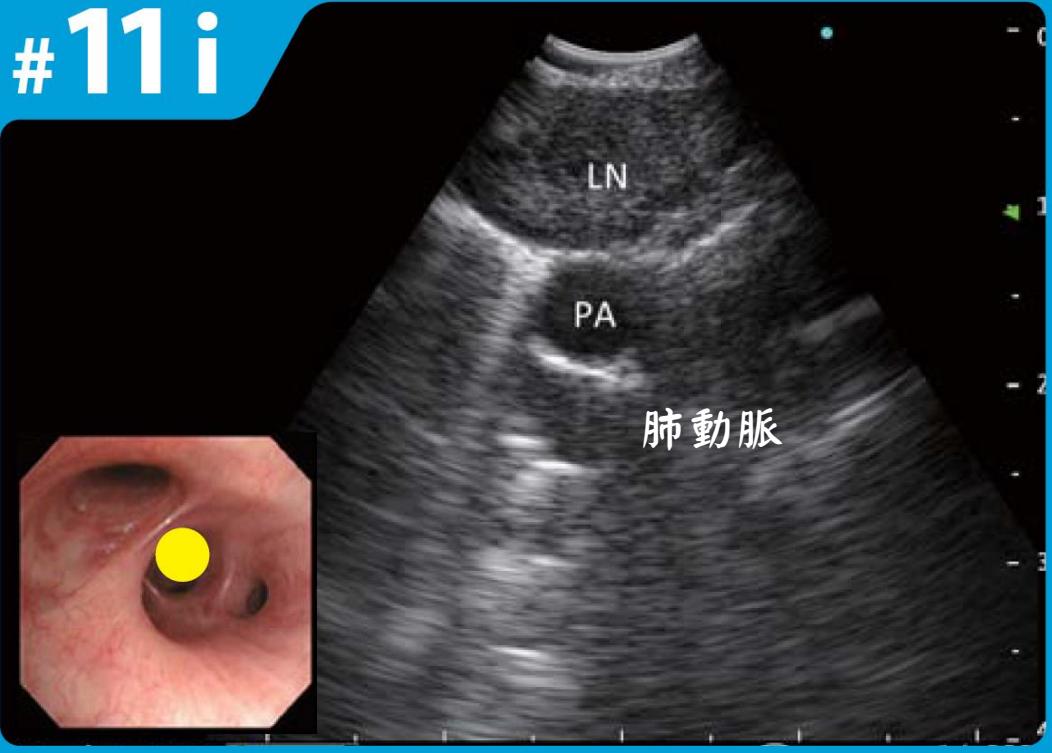

Group 11Rs

Straighten and withdraw the bronchoscope to the intermediate bronchus. Turn to the two o'clock position and press the tip just distal the entrance of the right upper lobe bronchus. Station #11R can be visualized with the interlobar pulmonary artery running distal to the lymph node.

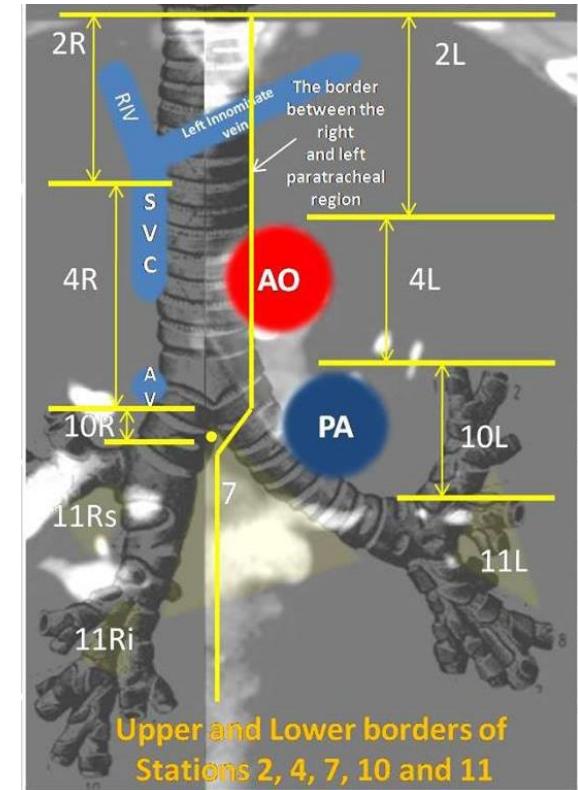

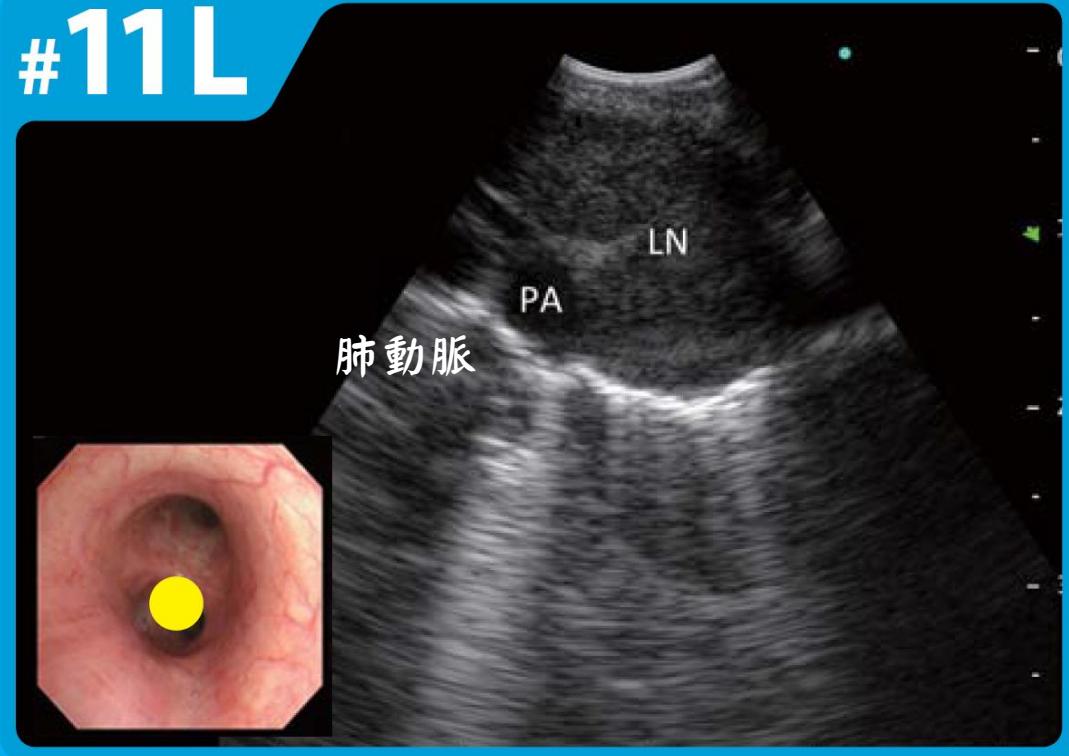

Group 11Ri

#11 i

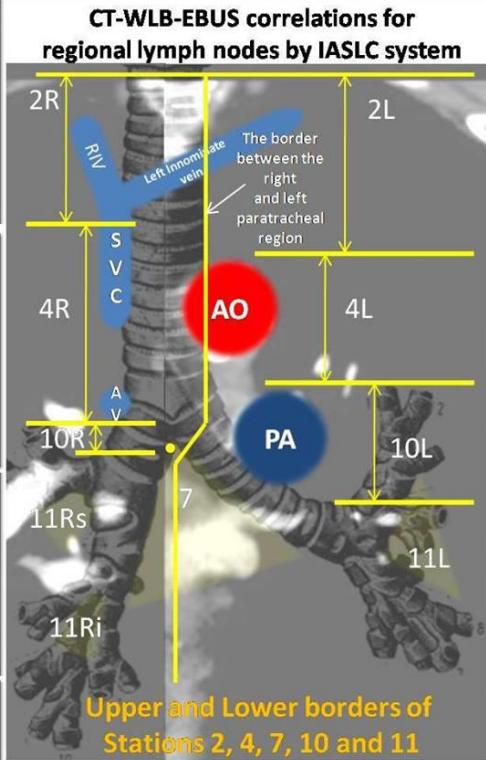

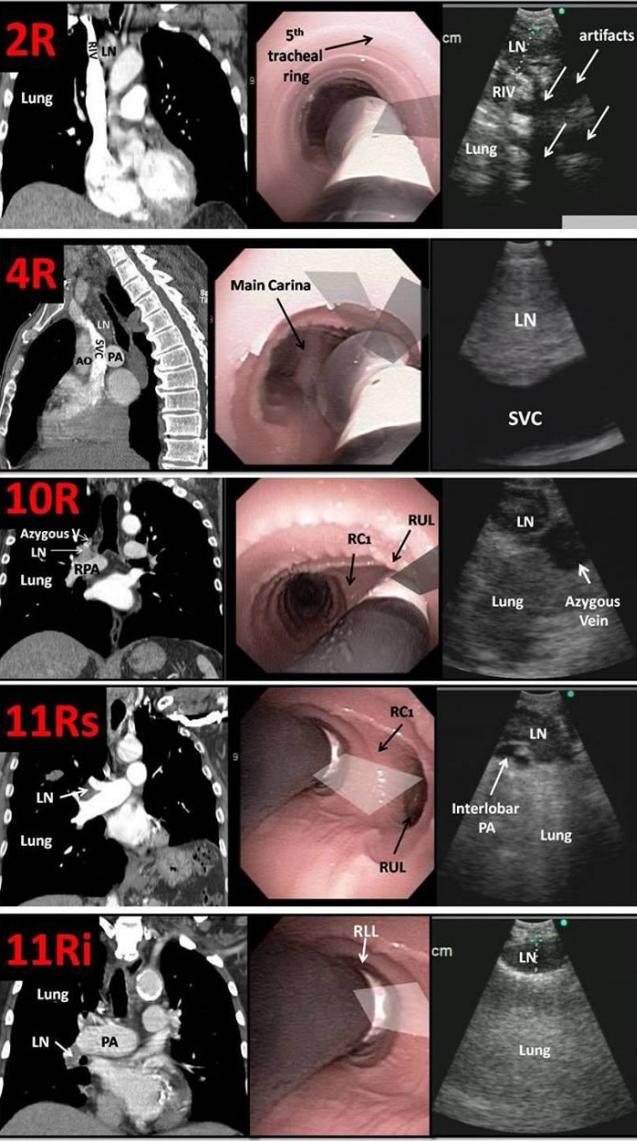

Group 11L

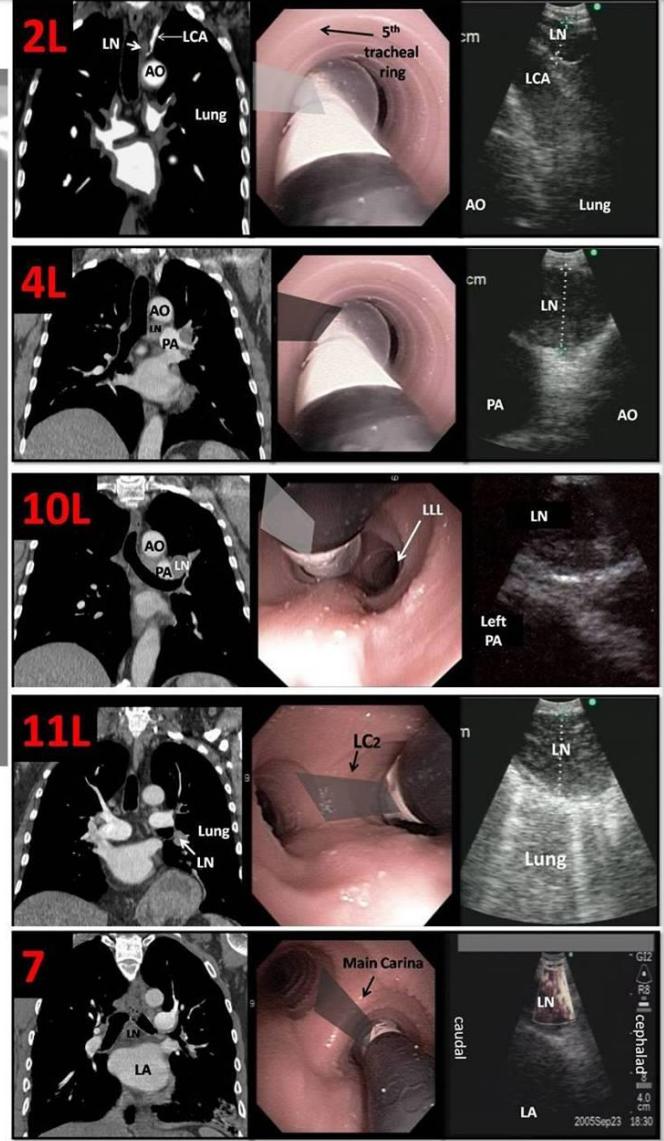

#11L

Further advancing the bronchoscope into the left lower lobe bronchus, press the tip at the two o'clock position in the carina of the upper and lower lobe bronchus. Station #11L is visualized adjacent to the interlobar pulmonary artery.

EBUS-TBNA操作介紹

BALLOON

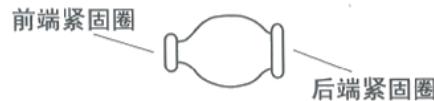

Balloon

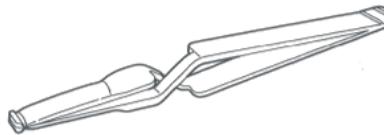

〈术语〉

- 水囊(MAJ-1351)

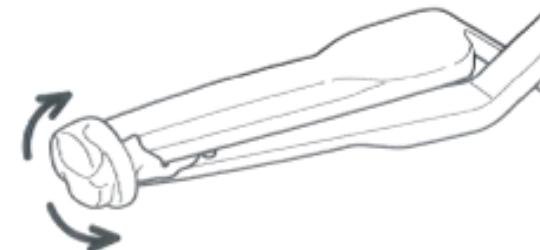

- 水囊安装镊子(MAJ-1352)

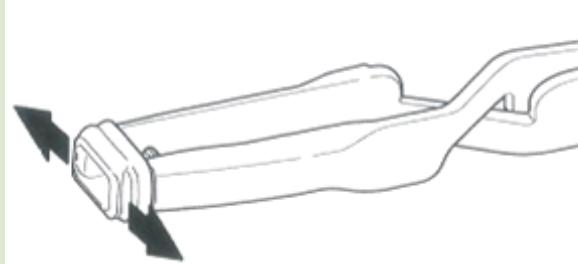

- 超音波探頭與呼吸道之間如果存在空氣，將不能獲得良好的超音波圖像，因此需要靠水來當作介質。
- 為防止形成假影，應移除水囊內所有氣泡，也必須預防水自水囊內漏出。

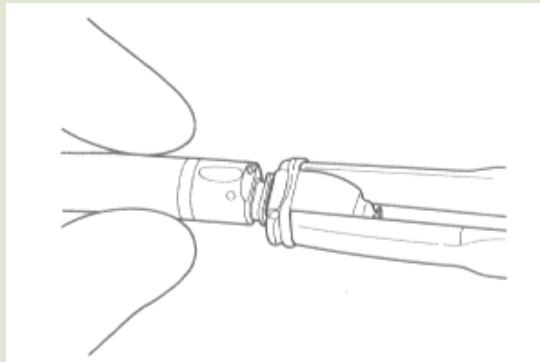

水囊安裝鑷子夾住水囊遠端

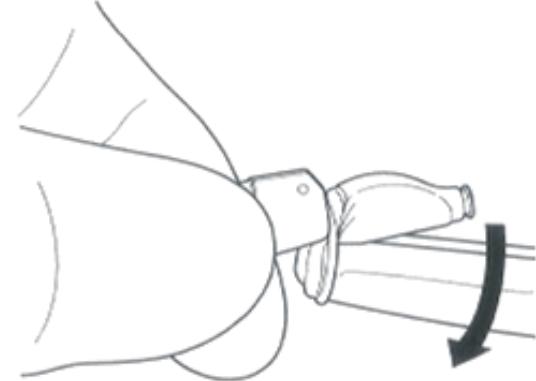

水囊近端向後反摺，將其放入水囊安裝鑷子的凹槽

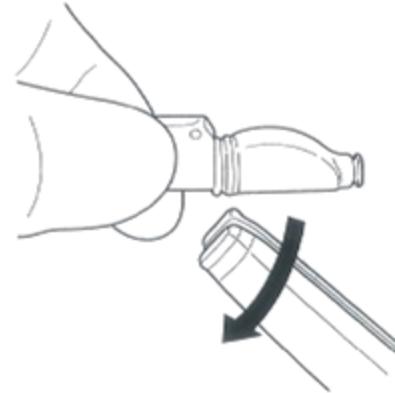

打開水囊安裝鑷子直至其擴展至內視鏡探頭的寬度

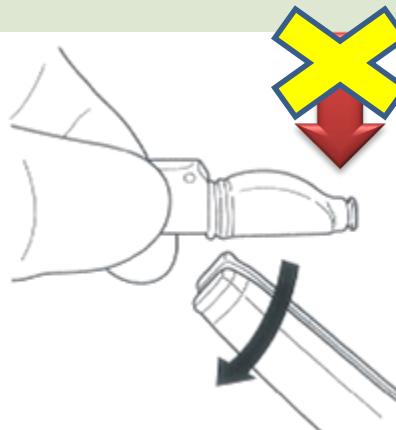

將水囊放置在超音波探頭上

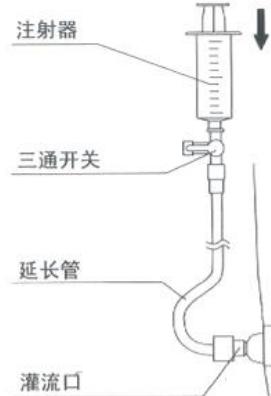

將近端反摺部分裝入內視鏡近端的凹槽內，將水囊安裝鑷子移向探頭的後端

持續向下移動水囊安裝鑷子至水囊近端的反摺部分完全裝入內視鏡近端的水囊凹槽內

不要嘗試放置水囊遠端的緊固部分，因之後需自該處將通道內的氣體完全移除

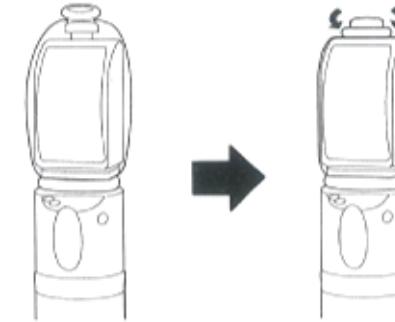

將針筒連接至活塞上，輕推針筒
以使無菌水分布在水囊內

使水囊略膨脹後，此時將內視鏡
遠端向上

用拇指及食指輕輕擠壓水囊，將
水囊內空氣及無菌水自遠端推出

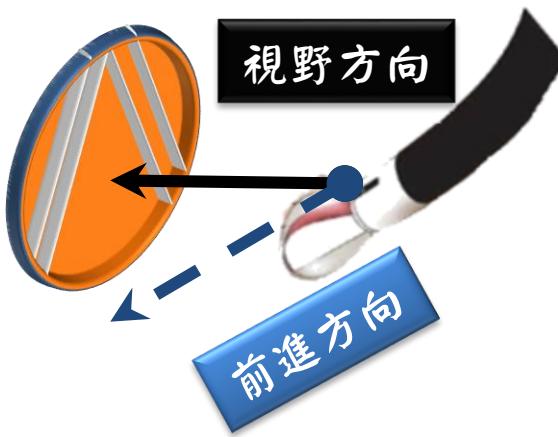

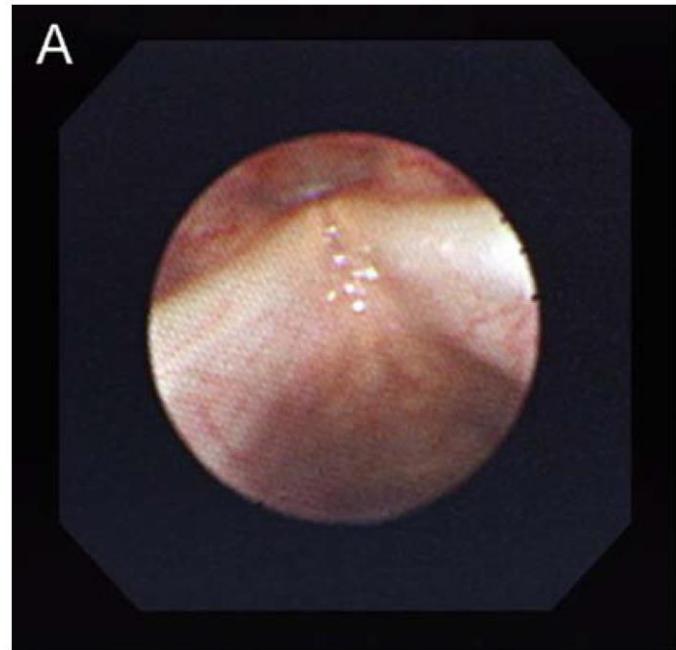

一旦水囊內氣泡消失，回抽針筒，
然後再將水囊遠端的緊固部分放
置入探頭遠端的水囊凹槽內

TBNA: How many passes per target site?

Eur Respir J 2007; 29: 112–116

Transbronchial needle aspirates: how many passes per target site?

CHEST 2008; 134:368–374

Real-time Endobronchial Ultrasound-Guided Transbronchial Needle Aspiration in Mediastinal Staging of Non-Small Cell Lung Cancer*
How Many Aspirations Per Target Lymph Node Station?

How many back and forth movement of the need passes per lymph node?

EBUS-TBNA: Are Two Needle Revolutions (Back and Forth Movement of the Needle Inside the Lymph Node) Adequate for Diagnosis of Lung Cancer?

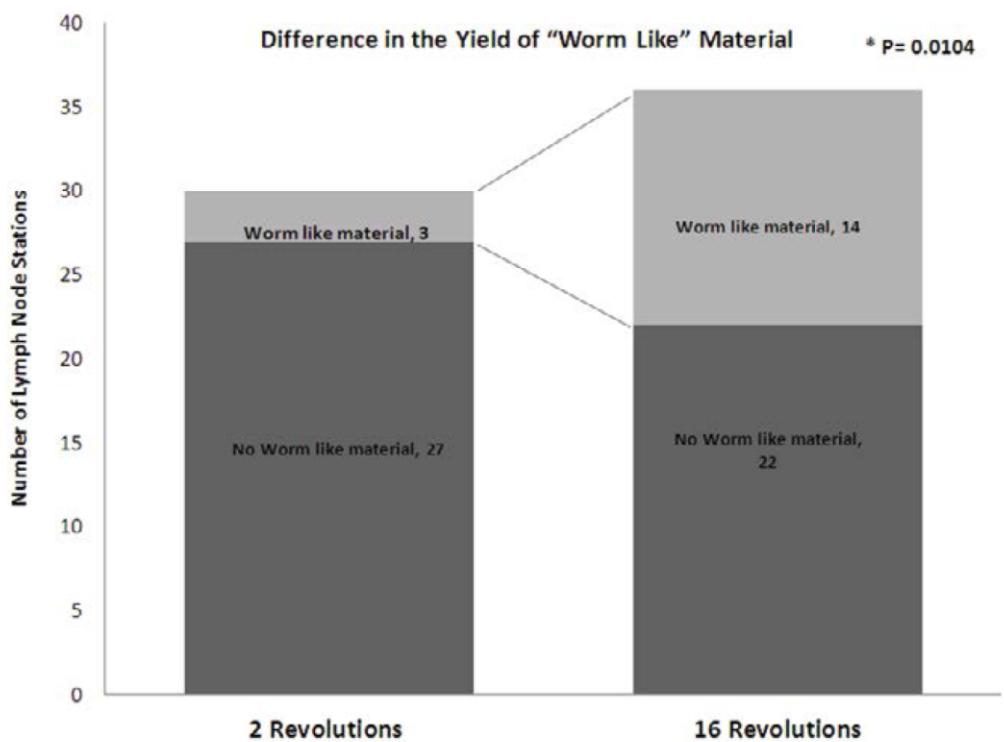

Figure 4: Although the worm like string of core tissue was obtained significantly more frequently with 16 revolutions ($P=0.0104$) as compared to two, this did not influence the diagnosis detection rate in case of malignancy.

- Standard procedure : 建議插10-20次
- 當進針至Lymph node時，插2次與插16次，診斷率相近
- 插16次可以取得worm-like specimen的機會比較高
- 需要比較多的組織，或是benign的病灶，建議插15-20次
- 只要staging的病人，可以插2次

TBNA: with and without aspiration?

Randomized Clinical Trial of Endobronchial Ultrasound Needle Biopsy With and Without Aspiration

Conclusions: Regardless of LN size, no differences in adequacy, diagnosis, or quality were found between samples obtained using EBUS-TBNA and those obtained using EBUS-TBNCS. There is no evidence of any benefit derived from the practice of applying suction to EBUS-guided biopsies.

- 有沒有使用negative suction對診斷沒有影響
- 有使用negative suction可能可以得到較大的組織
- 但使用negative suction可能會增加血液的contamination，使診斷困難度提高
- 血流量較高的組織，若要使用negative suction，建議negative pressure可以改為5或10ml，使得抽吸到的血液減少。

Conclusion of EBUS-TBNA

Useful staging tool

- EBUS-TBNA is useful as a staging tool in lung cancer patients, especially for bulky mediastinal disease and discrete N2 or N3 disease on CT

Lung tumor with mediastinal LAP

- Radial and Linear EBUS can help each other in diagnosing lung tumor with mediastinal LAP

Malignancy rather than lung cancer

- malignancy rather than lung cancer can diagnose by pulmonologist using linear EBUS-TBNA
