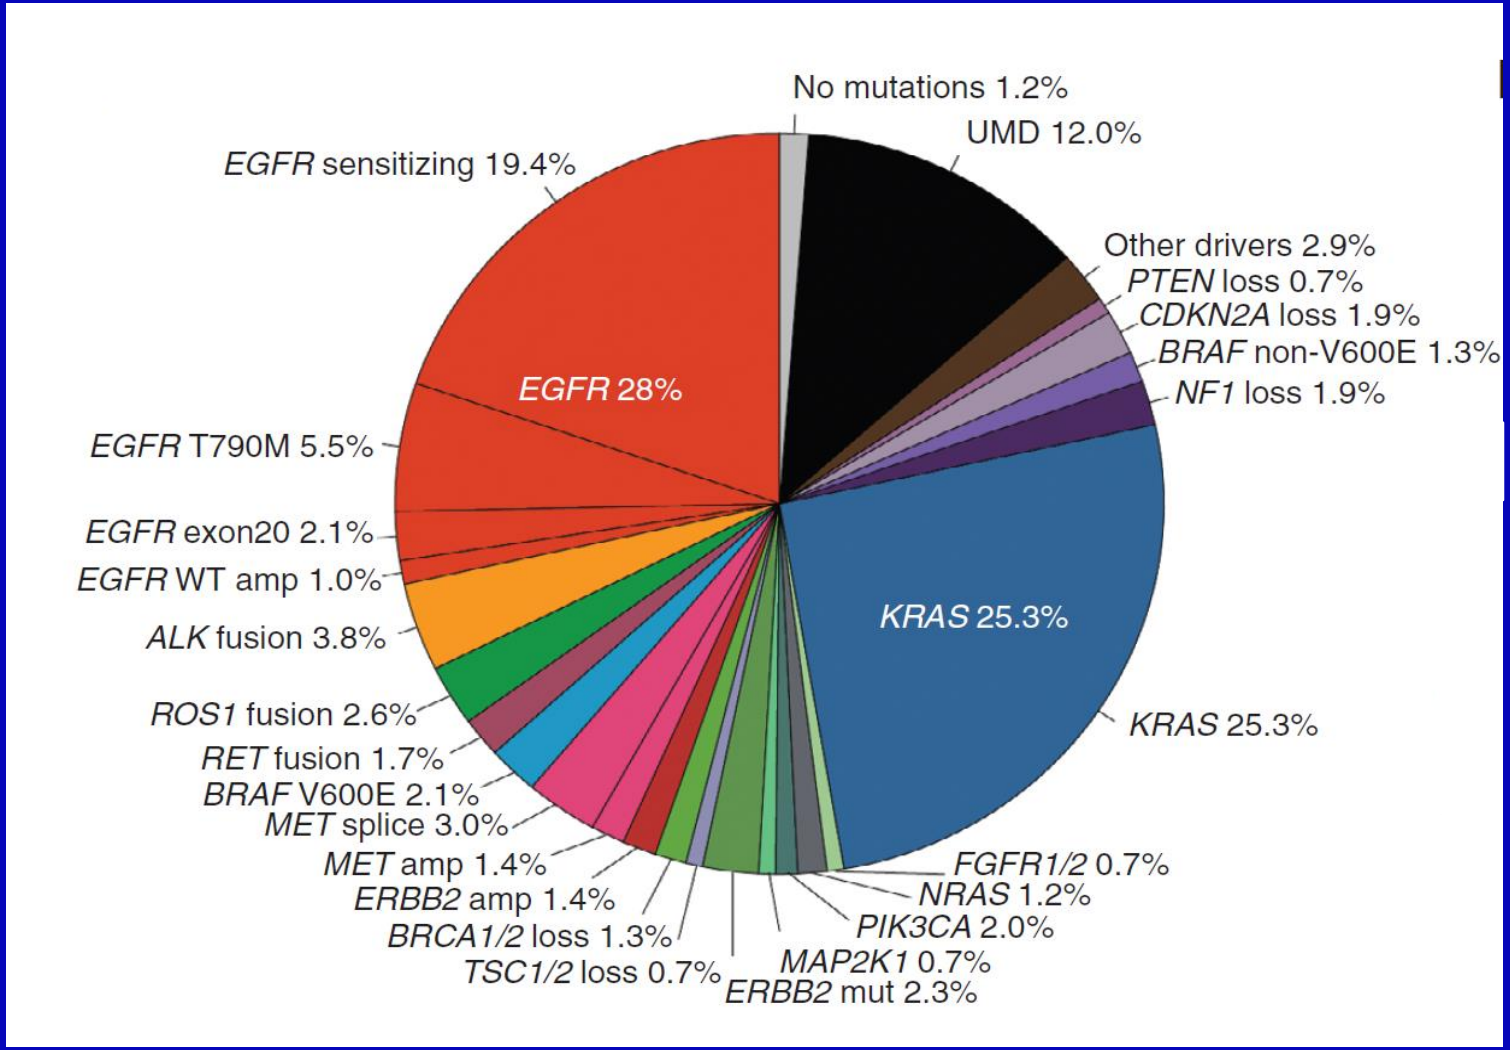
Potentially Actionable Oncogenic Drivers in Lung Adenocarcinoma



Jordan, et al. Cancer Discov 2017

Expanding List of Guideline Recommendations for Genomic Testing in NSCLC

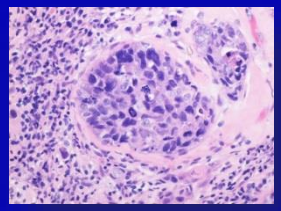
NCCN guideline has advocated broad molecular profiling as a part of the standard diagnostic evaluation for advanced NSCLC with the goal of identifying driver mutations for which effective therapies or clinical trials are available

Genomic alteration	Available targeted agents with activity against driver event in lung cancer
EGFR mutation	Osimertinib, erlotinib, gefitinib, afatinib, dacomitinib
ALK fusion	Alectinib, brigatinib, ceritinib, crizotinib, lorlatinib
ROS1 fusion	Crizotinib, Ceritinib
BRAF V600E mutation	Dabrafenib+ trametinib, vemurafenib
HER2 mutation	Ado-trastuzumab emtansine, afatinib
MET amplification/mutation	Crizotinib
RET fusion	Cabozantinib, vandetanib, LOXO-292
NTRK fusion	Larotrectinib, entrectinib
Tumor mutational burden	Nivoluamb+ ipilimumab, nivolumab

NCCN Clinical Guideline. NSCLC v3 2019

Evolution of Biomarker Test in NSCLC: Past, Current, Tomorrow

Tissue-based

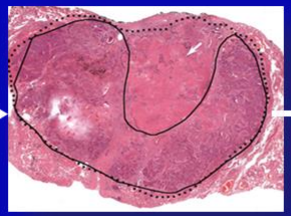


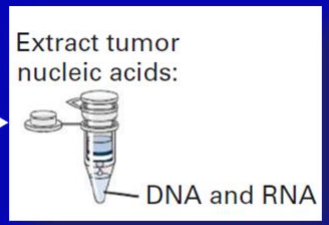
Past

Empirical therapy by clinicopathologic factors to select drugs for individual patients

Current

Target-based therapy by single-gene or multiplexed or NGS for decision-making





Single Biomarker Tests:
- Sanger DNA sequencing or pyrosequencing
- RT-PCR
- FISH

Multiplex, Hotspot Mutation Tests:
- PCR-based SNapShot
- PCR-based Mass Array SNP Sequenom

Next-Generation Sequencing:
- Whole genome or exome capture sequencing (DNA)
- Whole or targeted transcriptome sequencing (RNA)

Plasma-based

Tomorrow

Comprehensive genomic profiling by NGS of plasma ctDNA for decision-making

Modified from Li T. JCO 2013

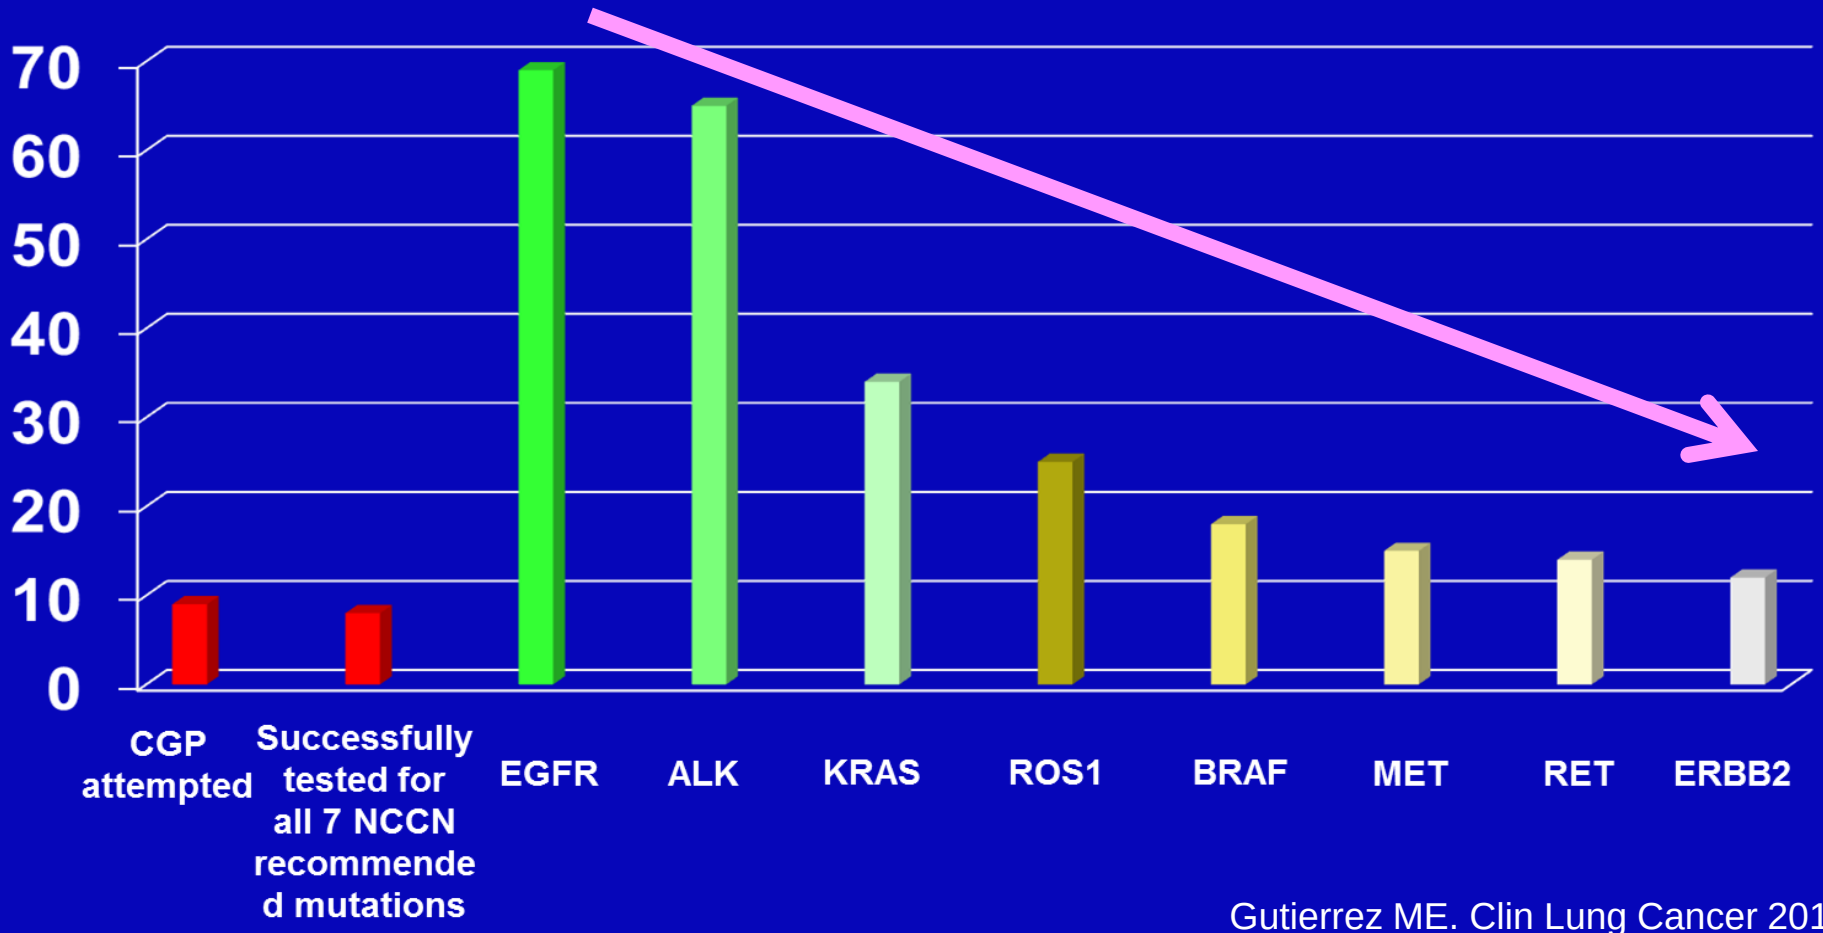
Barriers to Tissue Genomic Testing for Community Oncology Practice

- Insufficient tumor tissue
- Tumor location
- Long turnaround times
- Test reimbursement
- Patient co-morbidities
- Patient harm from the repeat biopsies (bleeding, pneumothorax)

Gutierrez ME. Clin Lung Cancer 2017

Genomic Profiling in advanced NSCLC: In reality…

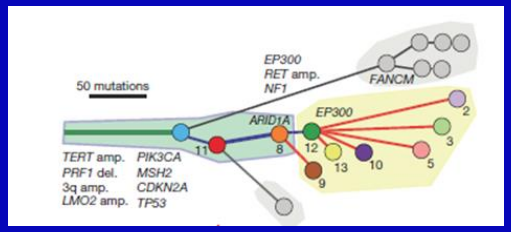
- Diagnostic accuracy is suboptimal ranging from 34-88%
- ~10% of patients are NOT tested because of insufficient tumor tissue
- ~30% of failure rate for NGS in routine pathological samples



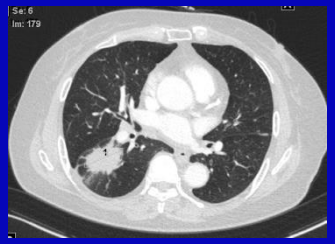
Gutierrez ME. Clin Lung Cancer 2017

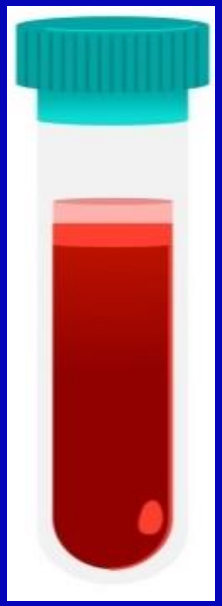
Clinical Application of Liquid Biopsy

Monitoring of tumor evolution

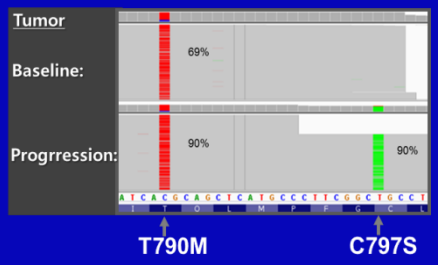


Identification of recurrence

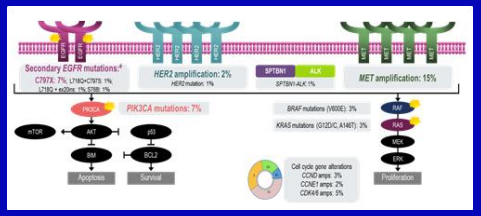




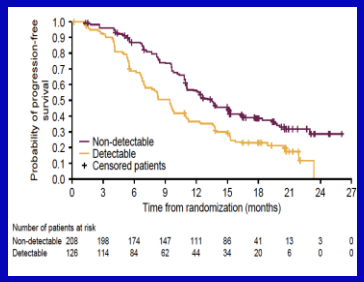
Identification of therapeutic targets



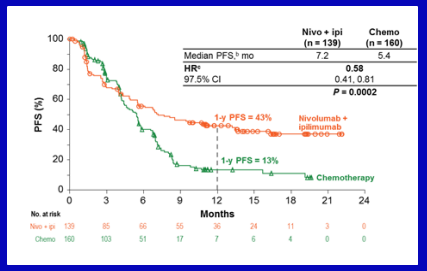
Identification of resistance mechanism



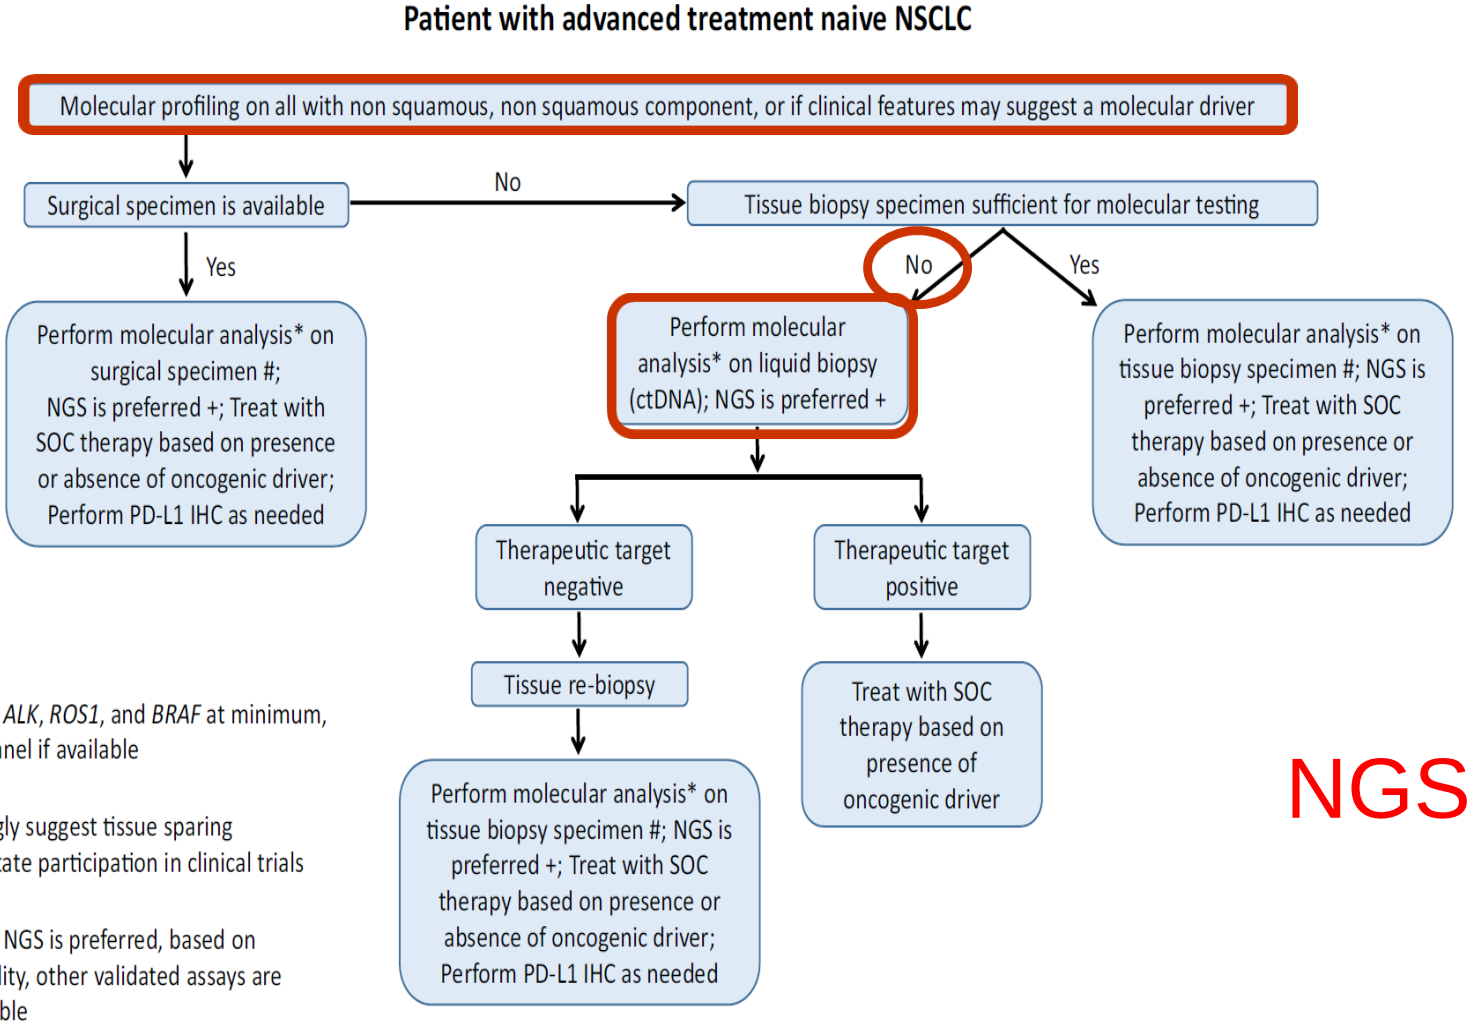
Response monitoring



Tumor mutation burden (Immunotherapy)



Liquid Biopsy for Advanced NSCLC: Consensus Statement from the IASLC (Rolfo C. JTO 2018)



NGS!!

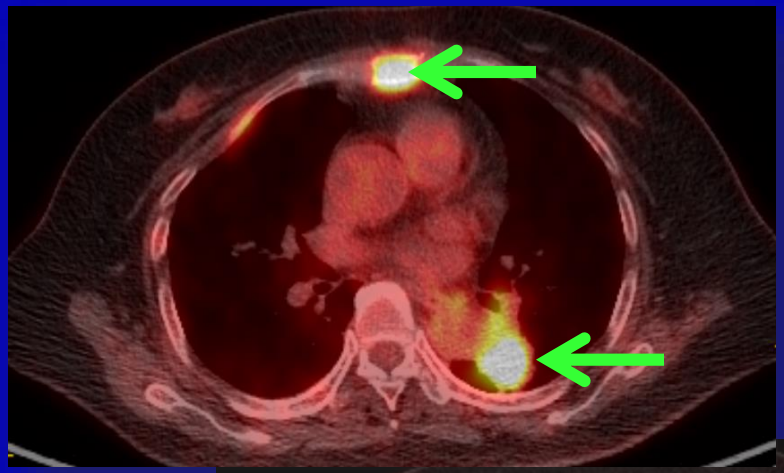
Can Plasma NGS Imporove Detection of Actionable Mutations?

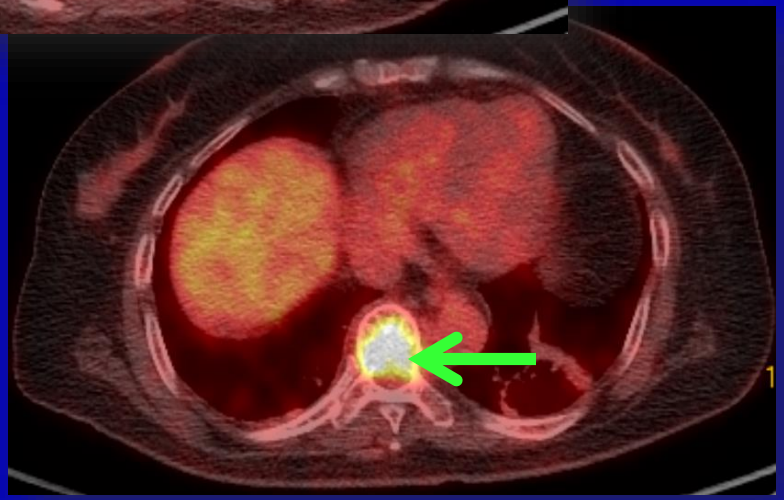
	Number	Success rate of tissue NGS	Plasma NGS	Concordance rate or PPA	Improved detection rate
Aggarwal C, et al. JAMA Oncol 2018	323	62%	Guardant360	81.3%	15.3%
Leighl NB et al. CCR 2019	282	-	Guardant360	>98.2%	48%
Itotani R, et al ESMO 2019	363	67%	Guardant360	75%	~14%

PPA, positive percent agreement

Case #1: 68-year-old lady

- Lifetime never smoker and housewife
- Present with cough and severe chest/back pain





What would you do first?

1) Only tumor biopsy with reflex single-gene assays of EGFR/ALK/ROS1 (turnaround time 1 weeks)
2) Only tumor biopsy with NGS on tissue for broader molecular profiling (turnaround time 5 weeks)
3) Tumor and liquid biopsy simultaneously
4) Liquid biopsy first

Tissue is an issue...?

Day 1
Came to clinic
Order for bronchoscopy

Day 4
Bronchoscopy done

Day 8
No evidence of malignancy reported

Day 8
Plasma ctDNA orderd

Day 15
Order for CT-guided NAB

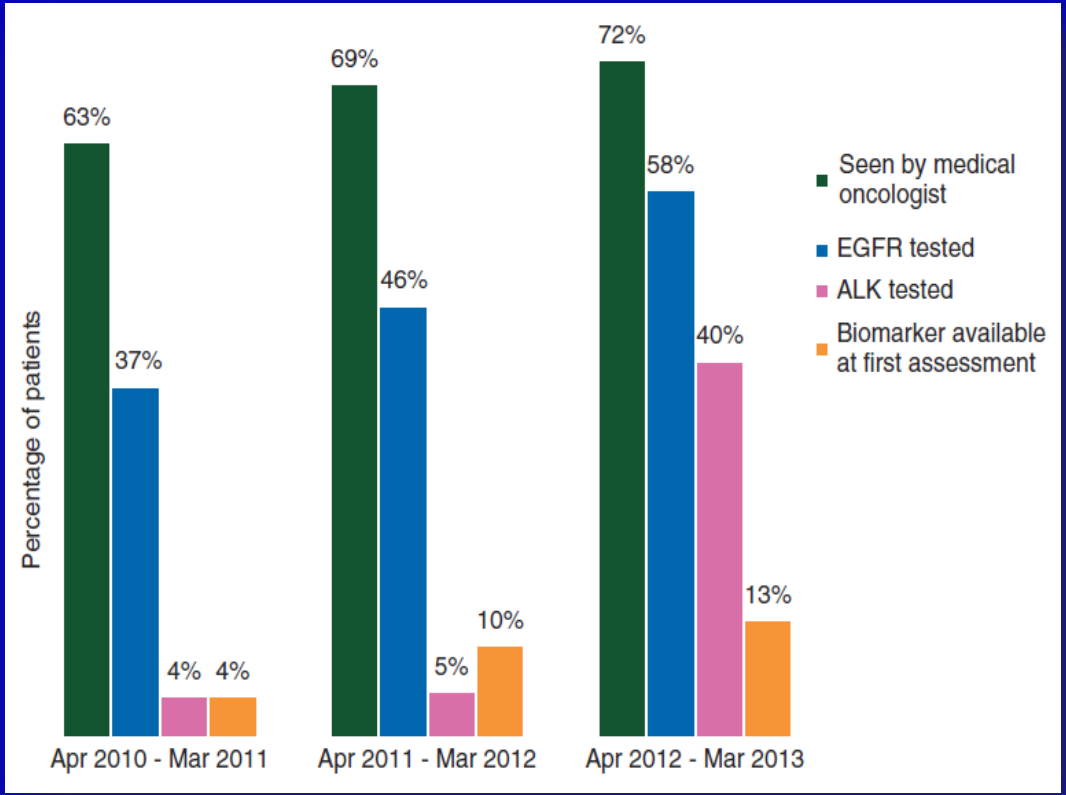
Day 18
CT-guided NAB done

Day 18
Plasma EGFR mutation reported

Day 23
Adenocarcinoma *EGFR* mutation reported

Day 38
Started osimertinib

Concurrent tissue and liquid biopsy should have been ordered….

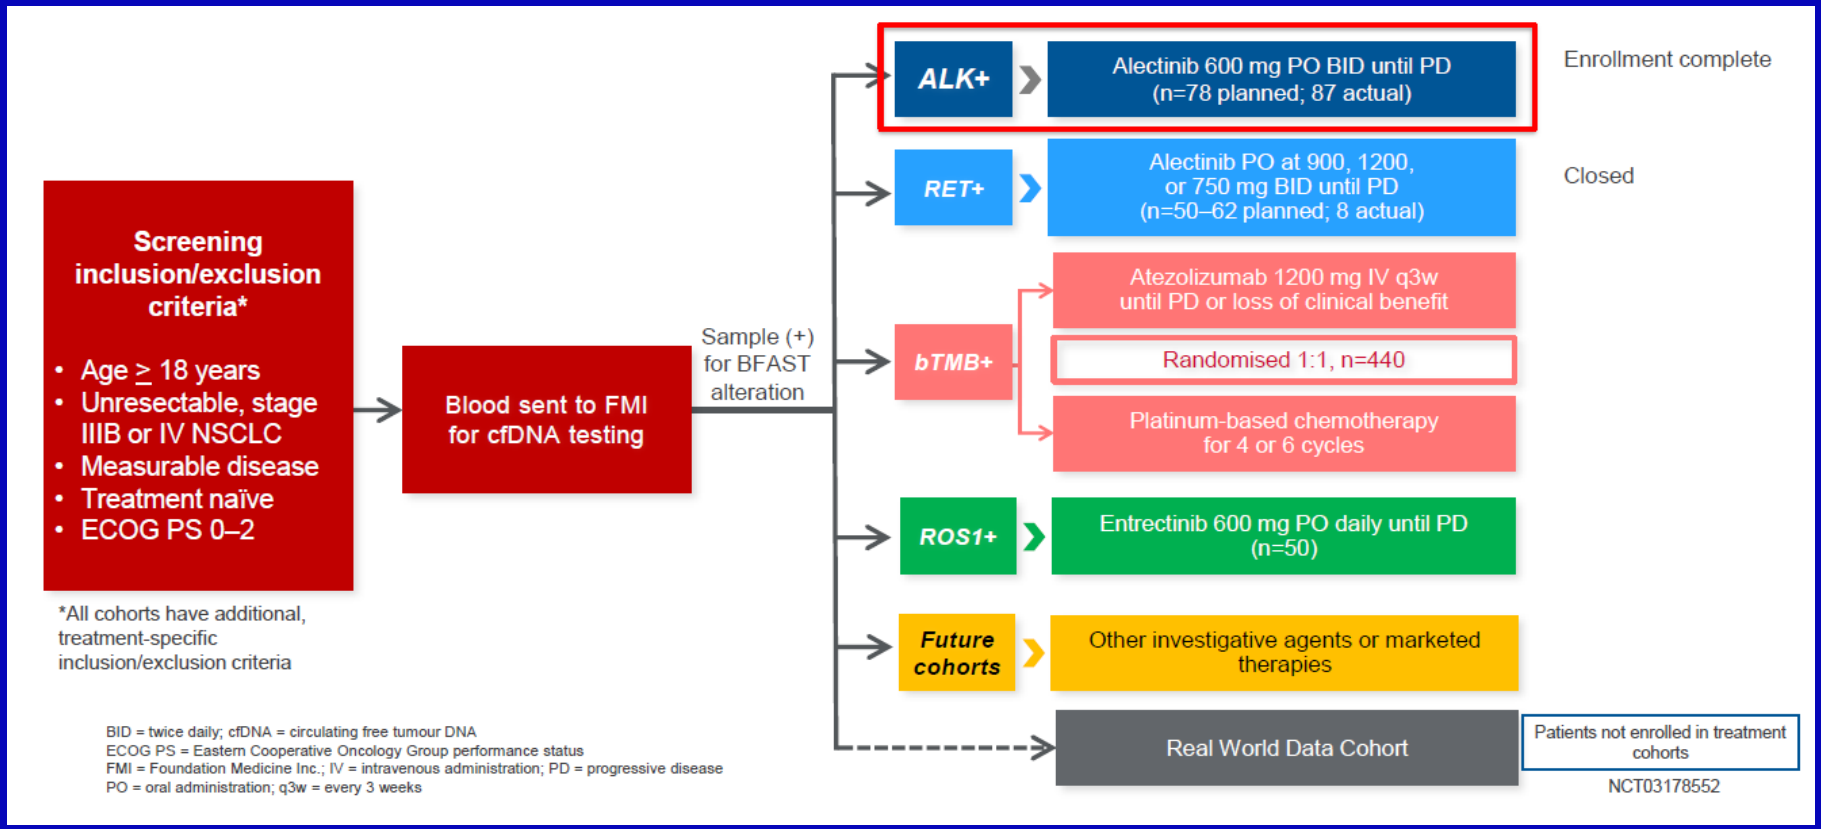


- Only 21% of patients with biomarker testing had results available at their initial oncology consultation
- 13% underwent repeat biopsy for molecular testing
- Delay treatment decision/initiation for advanced NSCLC

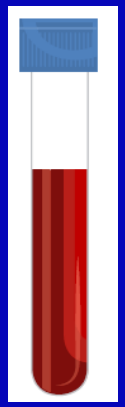
Lim C. Ann Oncol 2015

Can we start targeted therapy based on plasma result?

BFAST: blood-first screening trial in treatment-naive NSCLC

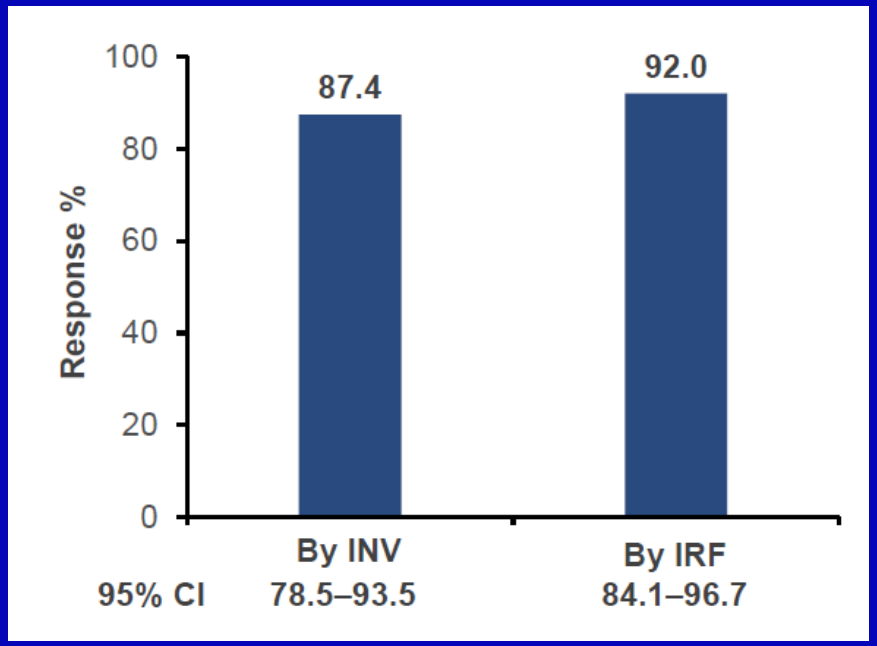


Gadgeel SM. ESMO 2019

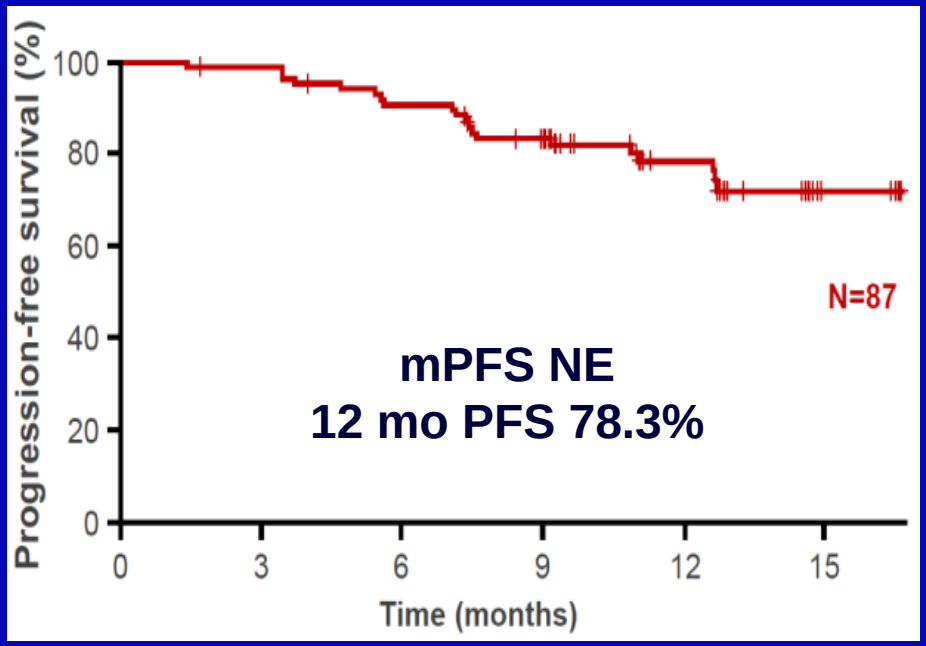


Positive ctDNA result represents sufficient evidence to initiate targeted treatment

ORR*



PFS*



*Efficacy similar to those from ALEX[1] (VENTANA D5F3)

[1]Peters S. NEJM 2017

VISION: Single-arm, Phase II trial of tepotinib in patients with NSCLC harboring MET exon14 skipping mutation (Guardant360)

Key inclusion criteria

- **Stage IIIB/IV NSCLC**
  All histologies
- ***MET*ex14 skipping**
  Tissue- (T+) and/or blood-based (L+)
- **First, second or third line of therapy**
  Prior immunotherapy allowed

Tepotinib 500 mg once daily

Selected endpoints

Primary endpoint

- ORR, RECIST v1.1 (by IRC)

Secondary endpoints include:

- ORR (investigator)
- Safety
- DOR
- PFS

Predefined analysis sets for efficacy:
*MET*ex14 detected by liquid biopsy or by tissue biopsy

Liquid biopsy positive n = 57; efficacy* n = 48

Tissue biopsy positive n = 58; efficacy* n = 51

Data cut-off: February 18, 2019

	Liquid biopsy positive		Tissue biopsy positive	
	IRC (n = 48)	**Investigator (n = 47)**	**IRC (n = 51)**	**Investigator (n = 51)**
ORR,* n (%) [95% CI]	24 (**50.0**) [35.2, 64.8]	26 (**55.3**) [40.1, 69.8]	23 (**45.1**) [31.1, 59.7]	28 (**54.9**) [40.3, 68.9]
mDOR, months [95% CI]	**12.4** [5.8, ne]	**17.1** [7.1, ne]	**15.7** [9.0, ne]	**14.3** [5.7, ne]
12-month event-free rate [95% CI]	**58%** [30, 78]	**55%** [28, 76]	**70%** [40, 87]	**59%** [32, 79]

*ORR: confirmed complete response or partial response; †mDOR for first-line treatment not mature at time of analysis.
CI, confidence interval; IRC, Independent Review Committee; mDOR, median duration of response; ne, not estimable; ORR, objective response rate

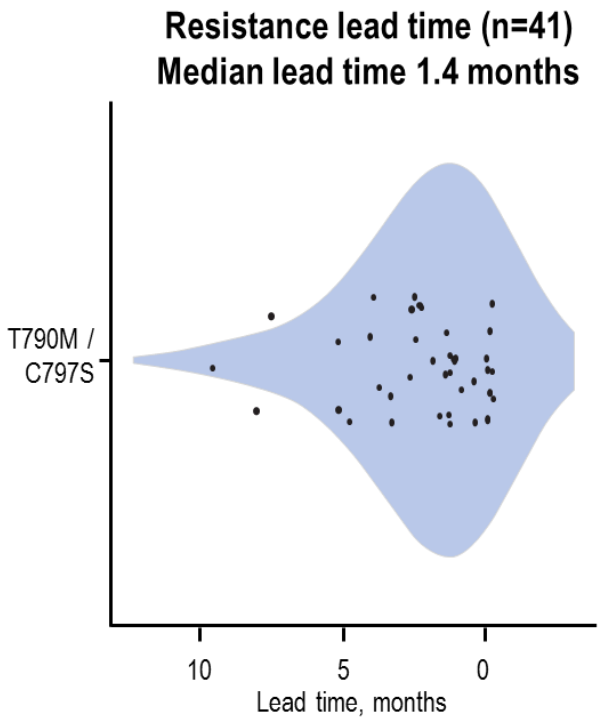
Blood sample every 4 months (up to 3 years) during follow-up for detection of ctDNA recurrence by LUNAR assay

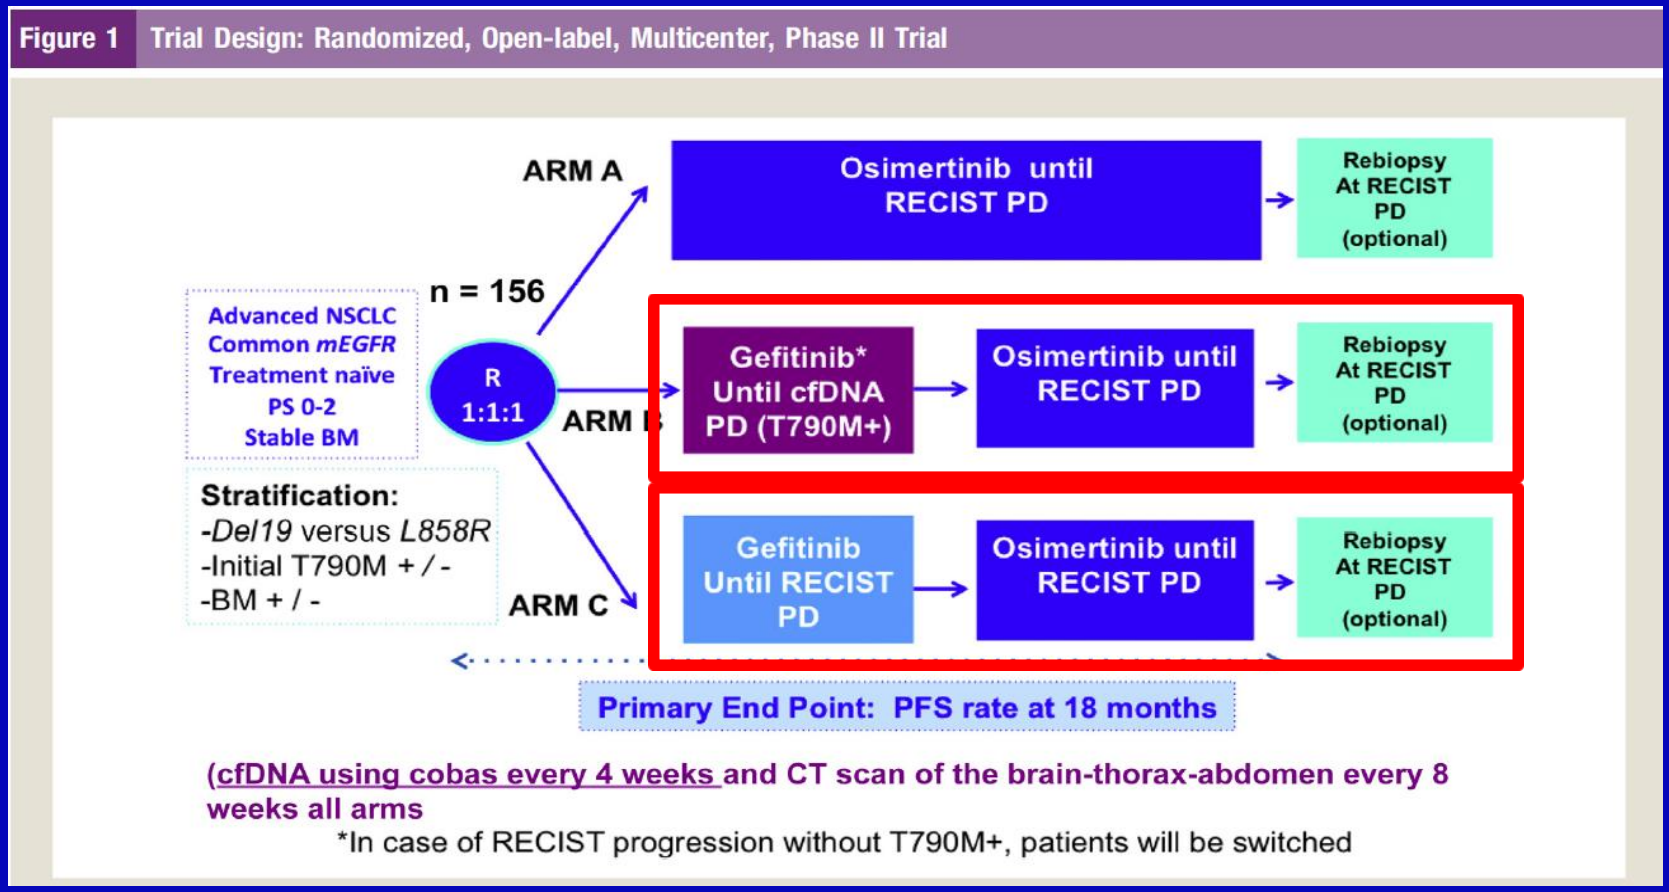
FLAURA ctDNA analysis: Early Detection of T790M or C797S EGFR mutation Before RECIST progression

- Acquired C797S and T790M resistance mutations were detected in 8% and 74% of patients with ctDNA PD in the osimertinib and comparator EGFR-TKI arms, respectively
- Median lead time to acquired C797S or T790M in patients with ctDNA PD and RECIST PD was 1.4 months (IQR 0.5–3.4 months)

Patients with ctDNA PD	Osimertinib (n=50)	Comparator EGFR-TKI (n=72)	Overall (n=122)
Resistance mutation detected, n (%)	4 (8%) C797S	53 (74%) T790M	57 (47%)
Median time to detection (IQR), months	16.7 (12.6–19.7)	8.4 (5.6–12.4)	8.4 (5.6–14.0)
Patients with ctDNA PD and RECIST PD	**Osimertinib (n=39)**	**Comparator EGFR-TKI (n=67)**	**Overall (n=106)**
Resistance mutation detected, n (%)	2 (5%) C797S	50 (75%) T790M	52 (49%)
ctDNA resistance lead time equivalent* or earlier, n (%)	2 (5%)	39 (60%)	41 (39%)



Modifying treatment prior to radiological progression



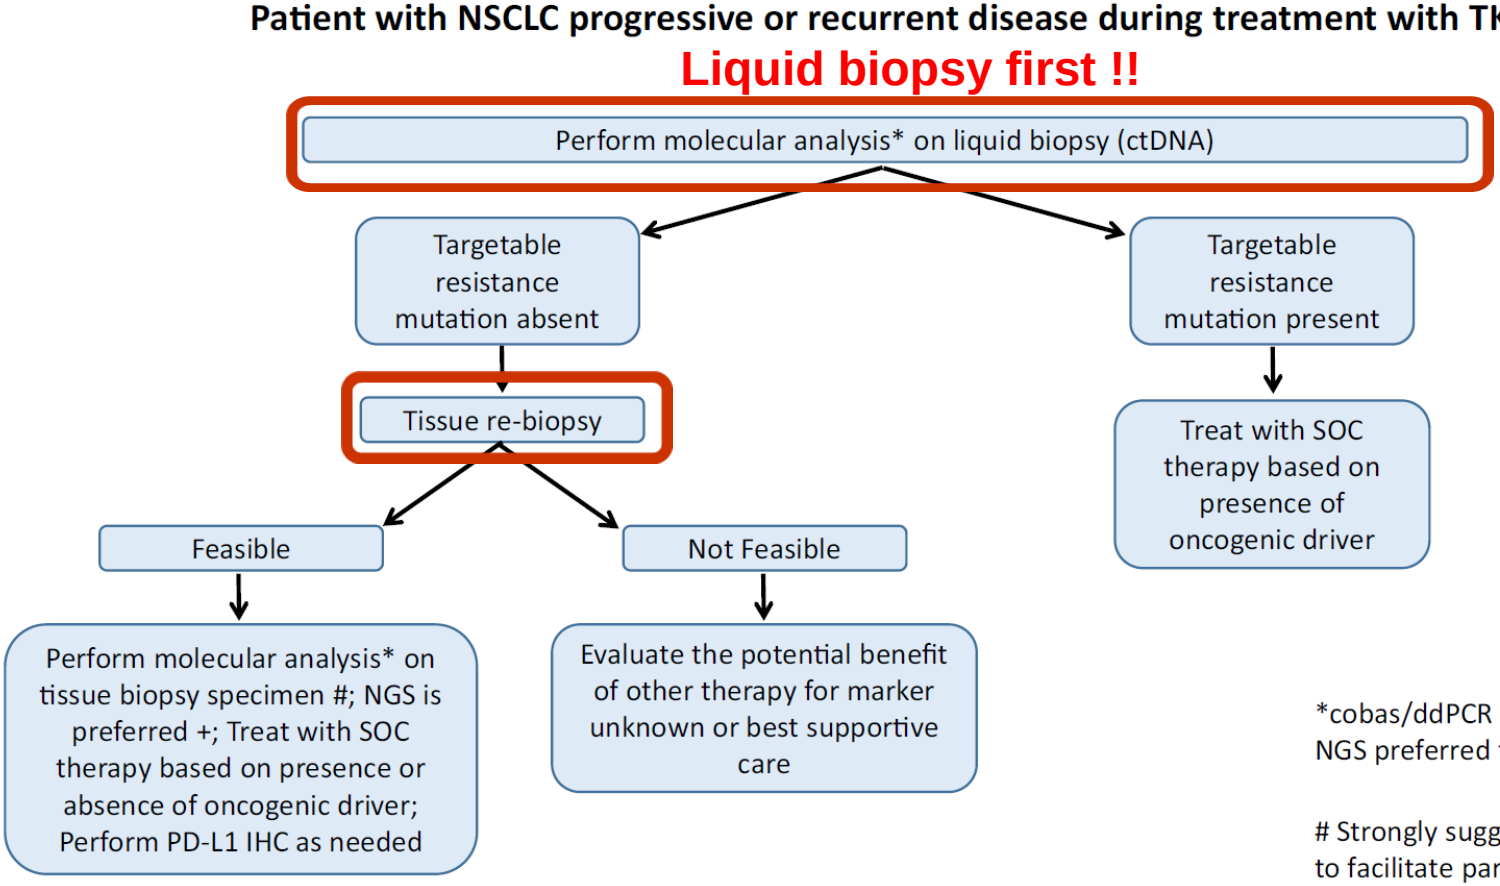
APPLE Trial: Feasibility and Activity of Osimertinib on Positive Plasma T790M in EGFR-mutant NSCLC Patients (EORTC 1613)

Remon J. Clin Lung cancer 2017

Key message: Liquid Biopsy in Treatment-naïve Patients

- Same criteria as molecular testing from tissue
  - ✓ Advanced nonsquamous NSCLC or squamous NSCLC with clinical features of a molecular driver
- Particularly recommended when tumor tissue is scarce or a significant delay (> 2 weeks) is expected in obtaining tumor tissue and in patients for whom invasive procedure may be contraindicated or with bone biopsy
- A negative ctDNA result should be followed up with tumor biopsy
  - ✓ False negative liquid biopsy result (sensitivity max ~85%)
- Patients should be drawn before any treatment

Liquid Biopsy for Advanced NSCLC: Consensus Statement from the IASLC (Rolfo C. JTO 2018)

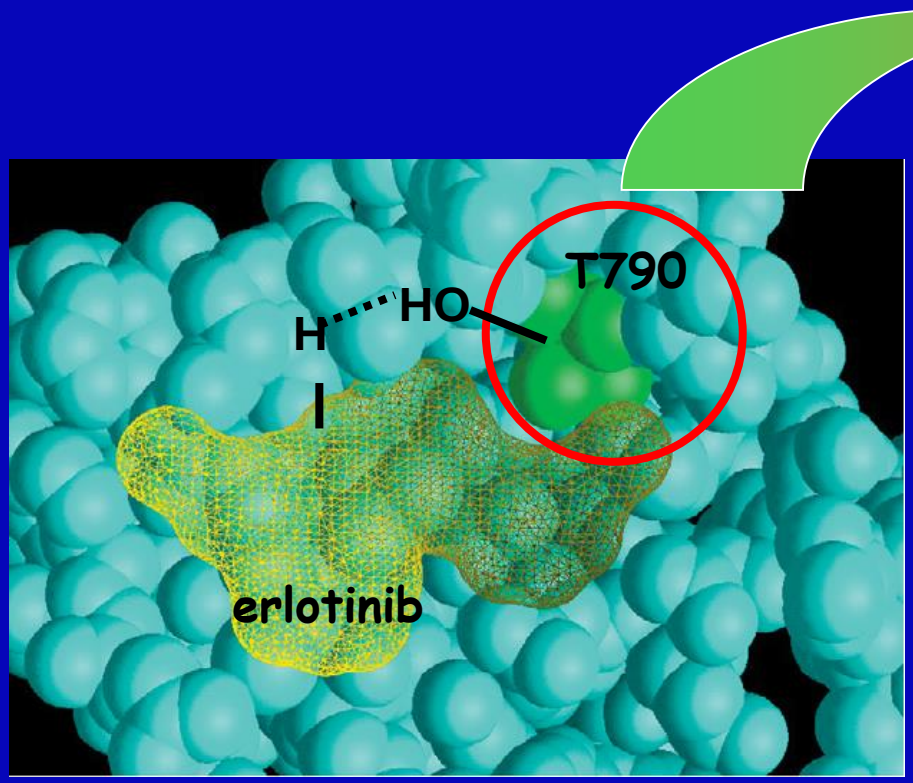


*cobas/ddPCR for *EGFR* mutation
NGS preferred for *ALK* and *ROS1*

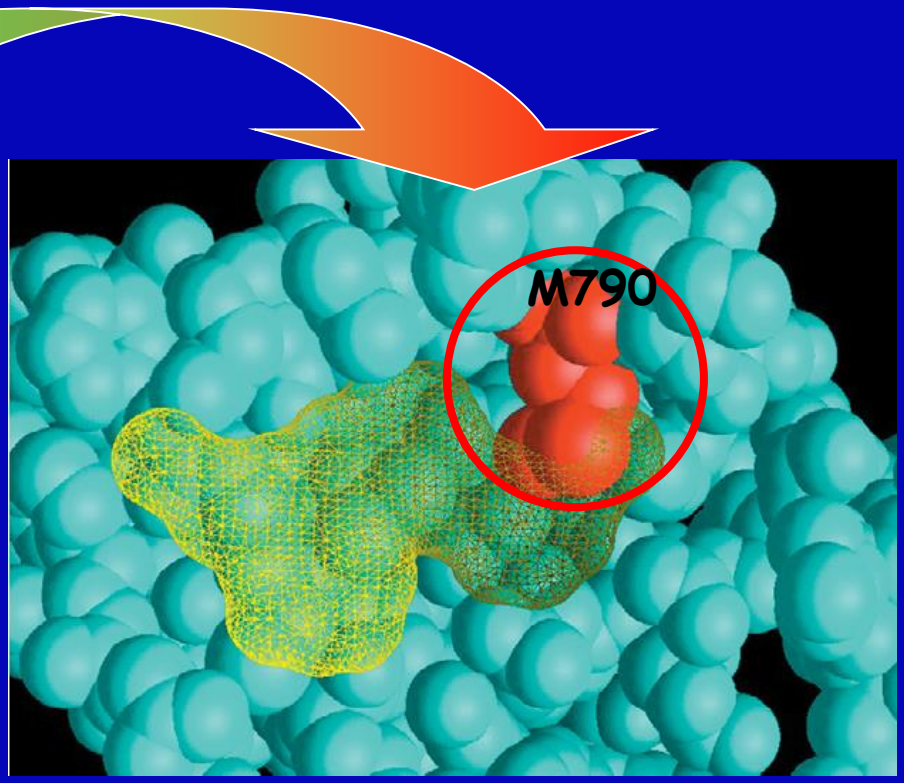
Strongly suggest tissue sparing to facilitate participation in clinical trials

+ While NGS is preferred, based on availability, other validated assays are acceptable

T790M Gatekeeper Mutation



Erlotinib bound to EGFR



Steric hindrance inhibits binding of erlotinib to catalytic site

EGFR T790M found in ~50% of patients who become resistant to gefitinib/erlotinib/afatinib

Why is the detection T790M important?

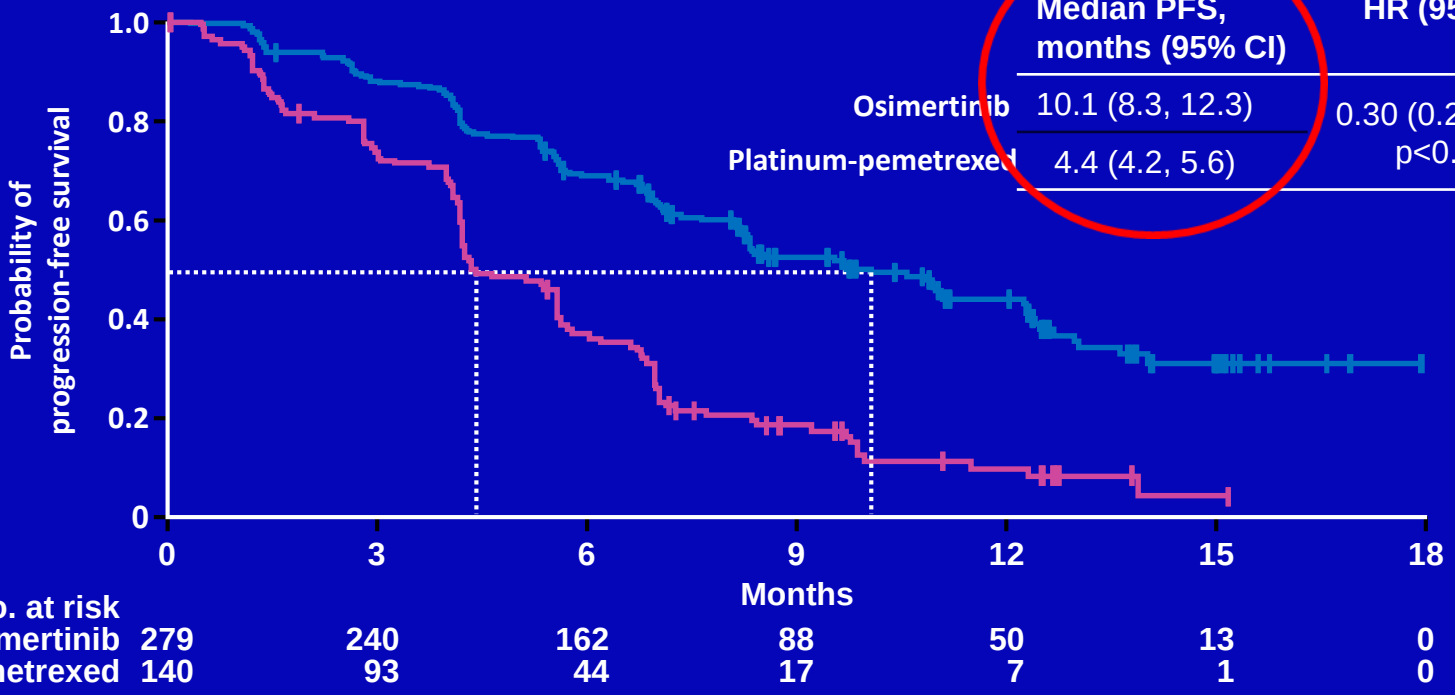
ORIGINAL ARTICLE

Osimertinib or Platinum–Pemetrexed in *EGFR* T790M–Positive Lung Cancer

T.S. Mok, Y.-L. Wu, M.-J. Ahn, M.C. Garassino, H.R. Kim, S.S. Ramalingam, F.A. Shepherd, Y. He, H. Akamatsu, W.S.M.E. Theelen, C.K. Lee, M. Sebastian, A. Templeton, H. Mann, M. Marotti, S. Ghiorghiu, and V.A. Papadimitrakopoulou, for the AURA3 Investigators*

Osimertinib- the only 3G EGFR TKI approved for patients with progression after EGFR TKI and harboring T790M

	Median PFS, months (95% CI)	HR (95% CI)
Osimertinib	10.1 (8.3, 12.3)	0.30 (0.23, 0.41) p<0.001
Platinum-pemetrexed	4.4 (4.2, 5.6)	



Why Should Liquid Biopsy be First in Lung Cancer Progressing during Targeted Therapy?

- Biopsy feasibility (~60%[1])
- Faster turnaround time
  - ✓2 (1-4) vs. 27 days (1-146)[2]
- HETEROGENEITY

[1]Kawamura T. Cancer Sci. 2016, Hong MH. YMJ 2019; [2]Sacher AG. JAMA Oncol 2016

Detecting T790M mutations in plasma

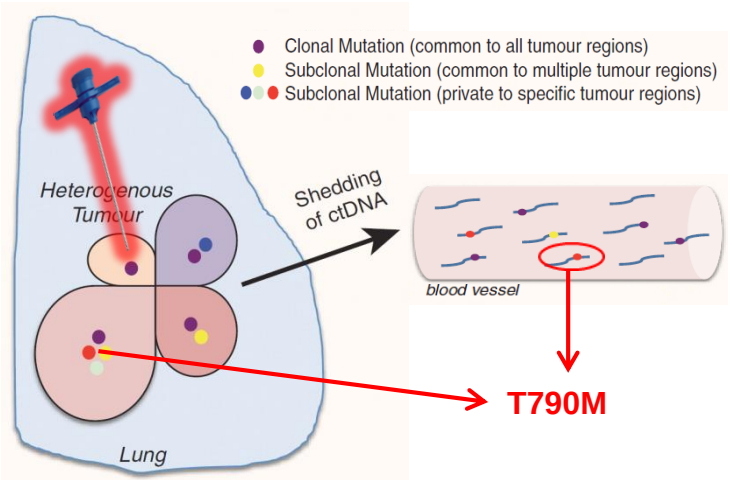
- Challenges:

✓ Very low concentration of the mutations

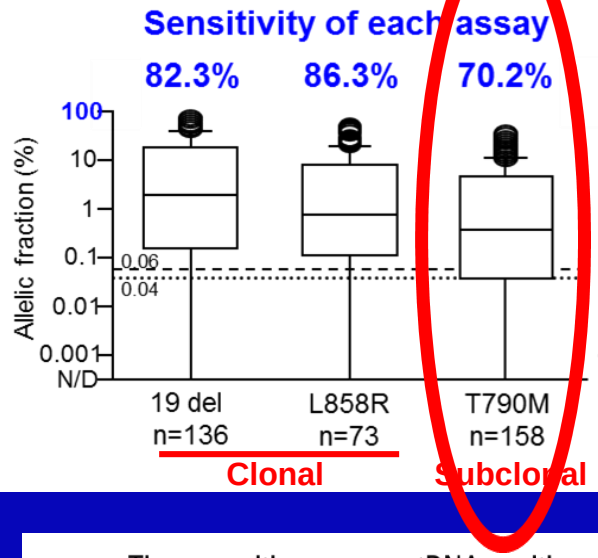
✓ High concentration of wild-type sequences from non-malignant tissues

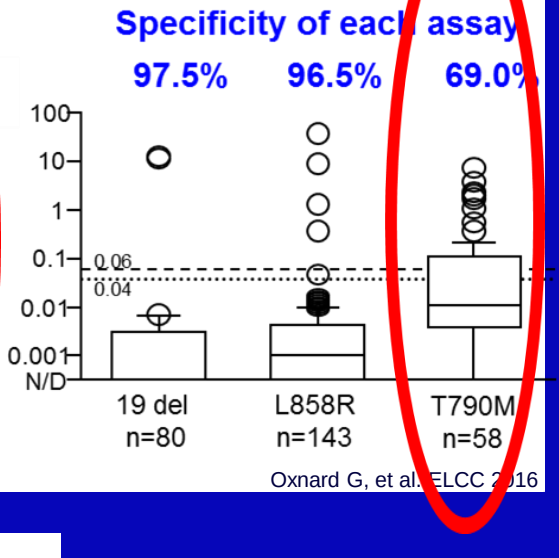
✓ Single nucleotide difference T790M

Clonal Mutations are More likely to be Detected than Subclonal Mutations in Plasma

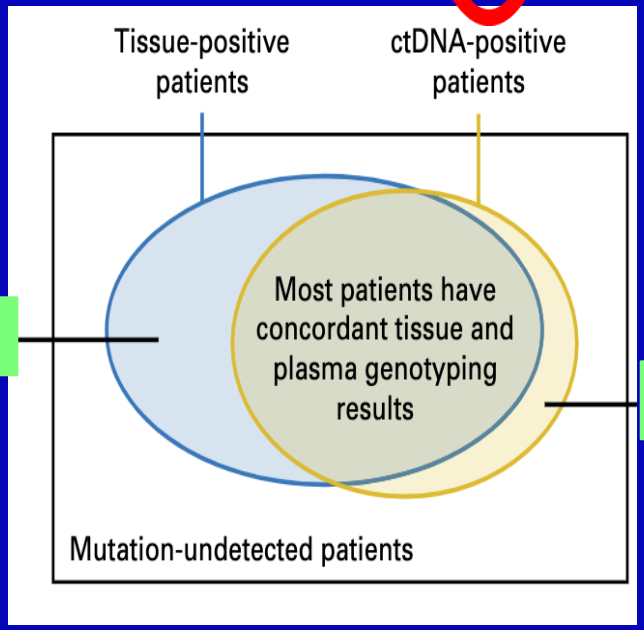


Murphy DJ. Cell Death & Differentiation 2017





Oxnard G, et al. ELCC 2016

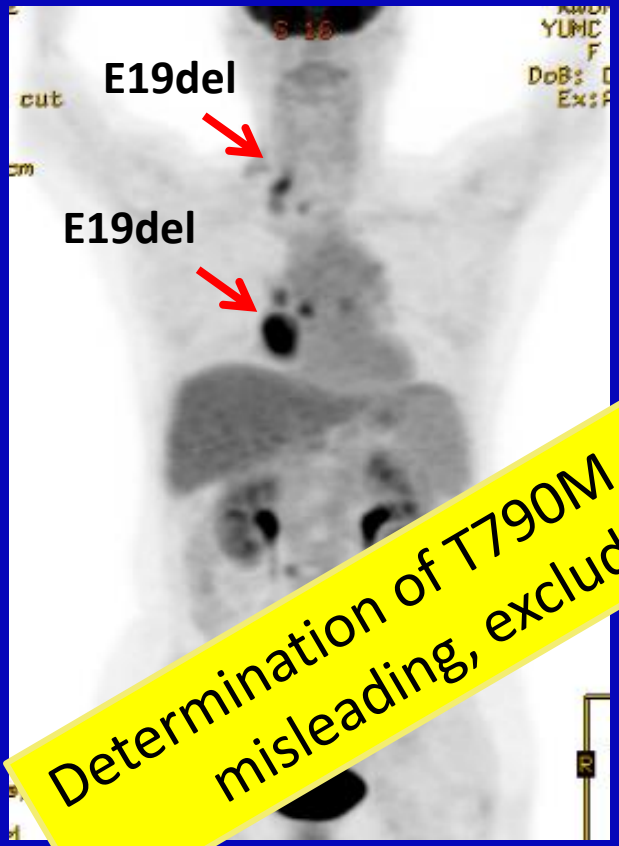


Tumor+/ctDNA-

ctDNA+/Tumor-

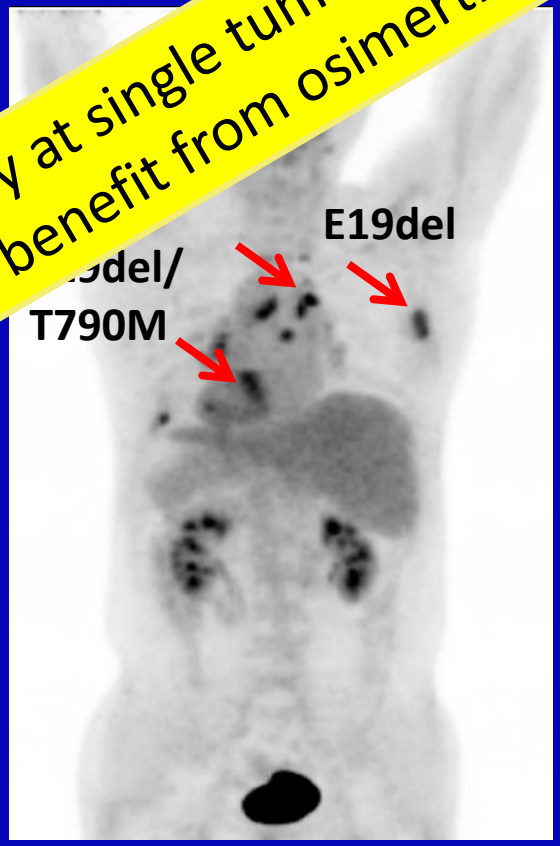
A single biopsy specimen may not represent intrinsic heterogeneity of a resistant cancer

Homogenous/Concordant



At diagnosis

Heterogenous/



At progression

Determination of T790M status based on biopsy at single tumor site may be misleading, excluding potential pts who benefit from osimertinib

Plasma assay performance for T790M detection using tissue test as reference

Platform	Sensitivity	Specificity	Reference
cobas	61	79	Jenkins, JTO 2017
cobas	51	77	Wu, WCLC 2016
cobas	73	67	Thress, Lung Cancer 2015
cobas	64	98	Karlovich, CCR 2016
ddPCR	77	63	Sacher, JAMA Oncol 2016
BEAMing	70	69	Oxnard, JCO 2016
BEAMing	73	50	Karlovich, CCR 2016
BEAMing	80	58	Thress, Lung Cancer 2015

- **50-77%** patients can have T790M mutation status determined without an invasive procedure
- Specificity issues in plasma assay likely from tumor heterogeneity (“False-positive plasma”)

Sensitivity of 3 Technologies for T790M detection (AURA 3)

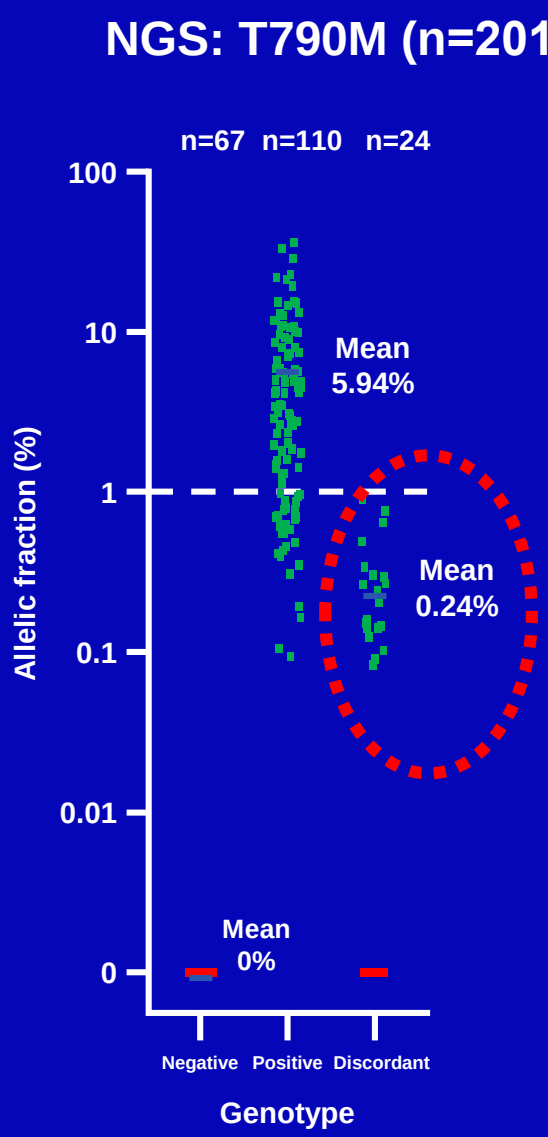
	T790M		Exon 19 deletion		L858R	
	PPA	NPA*	PPA	NPA	PPA	NPA
AS-PCR (Cobas® v2, n=226)	**51%** (115/226)	NA	**85%** (132/155)	**99%** (70/71)	**59%** (40/68)	**100%** (158/158)
ddPCR (Biodesix, n=208)	**57%** (118/208)	NA	**72%** (102/142)	**100%** (66/66)	**69%** (44/64)	**99%** (141/143)
NGS (Guardant Health, n=227)	**65%** (148/227)	NA	**81%** (126/156)	**99%** (70/71)	**62%** (42/68)	**98%** (156/159)

- Using the cobas tissue test as a reference, sensitivity for the detection of T790M was increased for ddPCR and NGS compared with AS-PCR
- Specificity of the tests for T790M detection could not be assessed because all patients were T790M positive by tissue test*

Population: osimertinib-dosed patients with a valid cobas tissue T790M-positive result and matched plasma samples
*Specificity for the detection of T790M was not evaluable as all patients enrolled in AURA3 were T790M positive
NA, not applicable; NPA, negative percent agreement (specificity); PPA, positive percent agreement (sensitivity)

Ahn et al WCLC 2017

T790M discordance by patient: ddPCR vs NGS



- 201 patients had a valid ddPCR and NGS plasma T790M test result
- 24 patients (12%) with a discordant result (i.e. differing mutation status by ddPCR and NGS) are shown here
- 100% of discordant samples had allelic fractions <1% in both assays
- 19/24 (79%) of discordant samples were ddPCR negative but NGS positive

Green = NGS positive result, red = NGS negative result; population: osimertinib-dosed patients with a valid cobas tissue T790M-positive result and matched plasma samples.

Plasma cfDNA positivity in T790M is predictive of tumor response (AURA)

		ORR (%)		PFS (months)	
	Platform	Plasma	Tumor	Plasma	Tumor
AURA, AURA 2	Cobas	64	66	NR	NR
AURA 3	Cobas	77	71	8.2	10.1
AURA	Beaming	63	62	9.7	9.7

Liquid Biopsy: NCCN Guideline & Recommendations

Key new recommendations include the inclusion of additional genes (ERBB2, MET, BRAF, KRAS and RET)… and the use of cfDNA to rule in targetable mutations when tissue is limited or hard to obtain.

- CAP/IASLC/AMP 2018 Molecular Testing Guidelines for Lung Cancer

Even for patients who are able to undergo a traditional tissue biopsy, a liquid biopsy may be safer, quicker and more convenient and perhaps even more informative.

- 2017 ASCO Clinical Cancer Advances

Use of cfDNA testing can be considered in specific clinical circumstances, most notably:

- If a patient is medically unfit for invasive sampling
- In the initial diagnostic setting, if following pathologic confirmation of a NSCLC diagnosis.. there is insufficient material for molecular analysis.. cfDNA should be used only if follow-up tissue-based analysis is planned for patients in which an oncogenic driver is not identified

- NCCN Treatment Guidelines 1.2019 Non-Small Cell Lung Cancer

Lindeman et al JTO 2018; Burstein et al. JCO 2017; NCCN Guideline, NSCLC

Our Experience of Guardant360 in Lung Cancer

세브란스병원 SEVERANCE HOSPITAL

M/48 stage IV lung adenocarcinoma

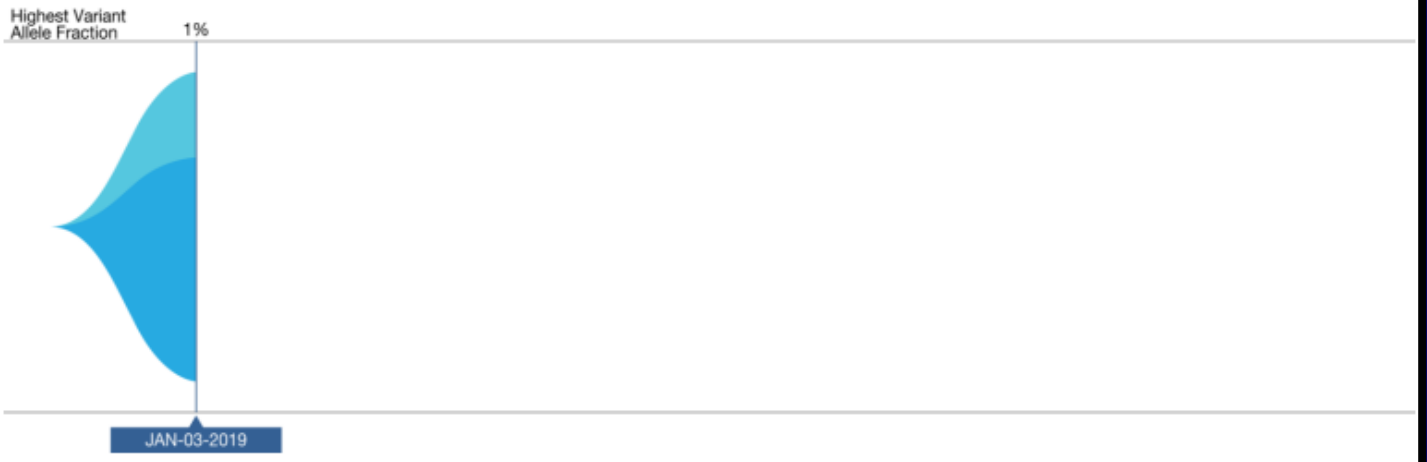
- Referred from another hospital
- Current smoker (30 PYS)
- EGFR cobas/ALK/ROS1 (-/-/-), SP263 10%
- Tissue insufficient for NGS
- s/p Pemetrexed/cisplatin (Apr 2018 ~ Jan 2019)
- Having progressive disease on Feb 2019

- What do you recommend to this patient?

Guardant360 Result

Guardant360 Tumor Response Map

The Guardant360 Tumor Response Map illustrates the variant allele fraction (% cfDNA) of observed somatic variants at each sample submission time point. Amplifications are not plotted, and only the first and last five test dates are plotted. Please see the Physician Portal (**portal.guardanthealth.com**) for the Tumor Response Map with all test dates.



Alteration	% cfDNA or Amp
EGFR T751_I759delinsD (Exon 19 deletion)	1.0%
TP53 H168L	0.3%

The table above annotates the variant allele fraction (% cfDNA) detected in this sample, listed in descending order.

Treatment course

Gefitinib 250 mg/day

Feb 2019 Mar 2019 May 2019

What if this patient was not lucky enough to have Guardant360?
Docetaxel, gemcitabine……. All ineffective therapies

F/69 stage IV lung adenocarcinoma

- Never smoker
- EGFR cobas WT, ALK/ROS1 (-/-), PD-L1 SP263 0%
- Oncomine comprehensive assay® : WT

No Tier I/II genetic alteration : EGFR, KRAS, BRAF, MET, PIK3CA, HRAS, NRAS, ERBB2, TSC1/2, FGFR1/2/3, ALK, RET, ROS1, NTRK1/3

Mapped Reads: 6,932,713 On Target: 98.05%
Mean Depth: 2,918 Uniformity: 97.65%
Total quality score: very good

- s/p Pemetrexed/cisplatin (Oct 2018.10~Dec 2018)
- After 2 cycles of docetaxel, she had to stop the chemotherapy due to severe toxicities (referred)

My Experience with Guardant360…….

- Satisfied with TAT and quality of report (simple and clear)
- Help find a new potentially effective treatment right on time
- Notably, help find level I/IIA biomarkers (EGFR, ALK, ROS1, RET, HER2 mutation etc) not detected by tissue PCR and NGS
- Useful in cases with insufficient tissue
- Help “laserpoint” the best EGFR-TKI

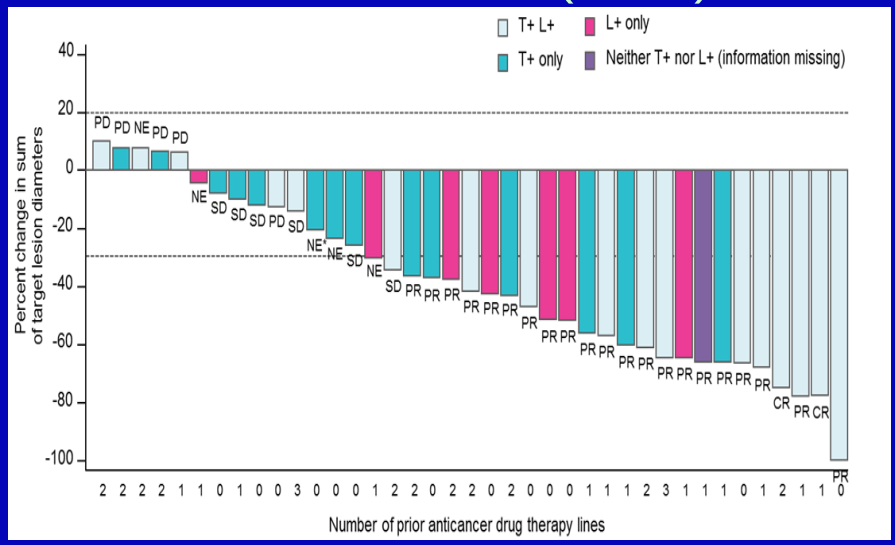
ORR 72.0% (95% CI: 50.6-87.9)

VISION Ph II (n=69)

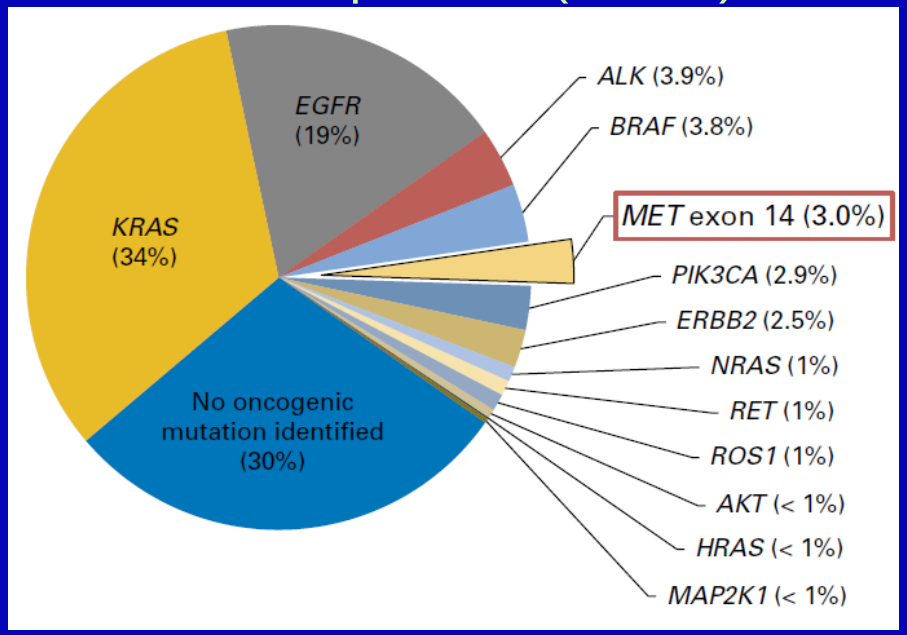


ORR 57.5% (95% CI: 40.9, 73.0)

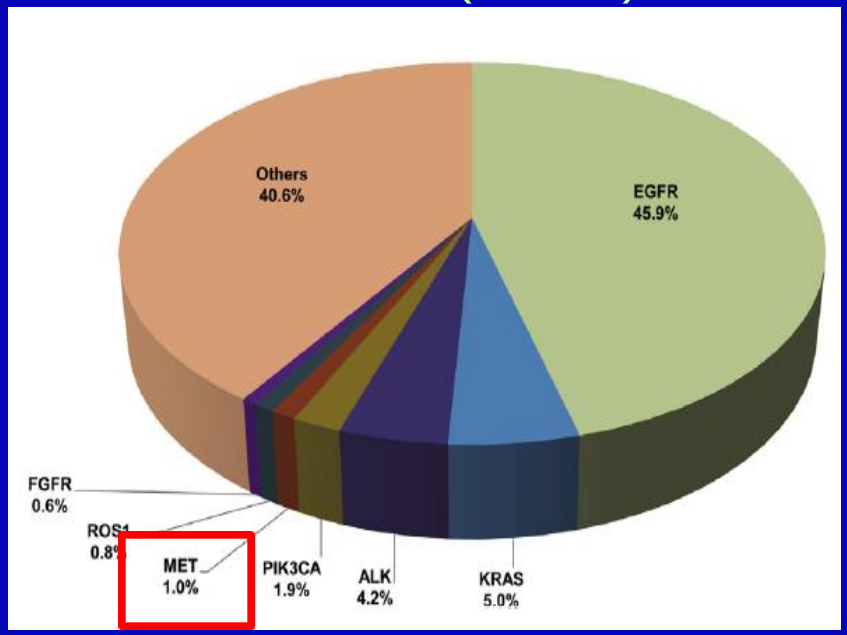
Wolf J. ESMO 2018; Felip E. WCLC 2018

MET exon 14 skipping represents a unique subset of NSCLC

White patients (n=933)



Chinese (n=968)



- Significantly older than EGFR/KRAS mutant patients/~60% smoker
- Occur predominantly in adenocarcinoma; enriched in sarcomatoid carcinoma (~20%)
- Up to 20% with concurrent high-level MET amplification
- Mutually exclusive with other oncogenic drivers (EGFR/KRAS/ERBB2)
- Diagnosis: DNA-based NGS
